Foreword

An increasing number of people live in small and medium-sized towns in the periphery of large cities as the world completes its process of urban transition. India is no exception to this phenomenon. It is in these towns where national economies are to be built, solutions to global challenges such as inequality and the impacts of climate change are to be addressed, and future generations are to be educated. The reality in India, however, suggests that the small towns are not fully integrated in the urban fabric of the nation. They have enormous backlogs in economic infrastructure, weak human capacity, high levels of under unemployment and unemployment, and extremely weak local economies.

However, with their growing numbers – there are more than 2,500 new towns added in the last Population Census – the role of small and medium-sized towns in the national economy will have a significant influence upon the future social and economic development of larger geographic regions. If these towns were better equipped to steer their economic assets and development, the national Gross Domestic Product (GDP) could be increased, with significant benefits reducing rural poverty in the hinterlands.

This research on small towns, those below 100,000 population, was conducted at the National Institute of Urban Affairs (NIUA), New Delhi, under Phase III of the HUDCO Chair project during the period 2015-16. This publication titled “Towns of India: Demography, Economy and Social Structures, and the Status of Basic Infrastructure and Housing” is a part of the three-year study which looks at the various size classes of urban settlements in India.

Phase I of the study was based on an in-depth analysis of the available secondary data of all the metropolitan cities. Phase II focused on cities with a population of 0.1 million to 1 million. The present report analyses the trends of urbanisation, basic infrastructure, housing and levels of the social indicators in small towns. The central message of the report is that in such towns where the demographic growth rates have increased in the past decade the quality of housing and infrastructure is poor as compared to the Class I and other metropolitan cities. Also, such towns are seldom able to mobilise financial resources on their own or access government or institutional funding. The new census towns, which have come up in significant numbers in the last decade largely fall in this category. Importantly, these towns, although urban by definition, are still under rural governance and report larger deficiencies as compared to their statutory counterparts. Adequate investments have to be made in these towns to improve the condition of housing and basic infrastructure.

We hope that this report will help the government in informed decision making and help formulate a stratified urban policy. It is expected to help policy makers in taking forward the newly launched Missions, namely, Pradhan Mantri Awas Yojana, Smart Cities Mission, Swatch Bharat Mission and Atal Mission for Rejuvenation and Urban Transformation in a bid towards building a vibrant and inclusive India. We hope that this contributes to a better understanding and appreciation of the vital importance of small towns in the national economy, and helps to increase their role in making relevant local contributions to the solution of shared developmental challenges.

Acknowledgements

We are grateful to Housing and Urban Development Corporation (HUDCO) for supporting this study titled "Towns of India – Status of Demography, Economy, Social Structures, Housing and Basic Infrastructure". We wish to sincerely thank Dr. M. Ravi Kanth, Chairman and Managing Director, HUDCO for his kind support in this endeavour. Thanks are also due to Mr. N.L. Manjoka, Director (Corporate Planning), HUDCO, Mr. Rakesh Kumar Arora, Director (Finance), HUDCO, Dr. S.K. Gupta, Executive Director (Projects), HUDCO, and Dr. H.S. Gill, Executive Director (Training), Human Settlement Management Institute (HSMI). We acknowledge the valuable cooperation of Dr. Manika Negi, Fellow, HSMI coordinator of the HUDCO Chair activities at HSMI. We sincerely appreciate the contribution of Dr. Akshaya Kumar Sen, Fellow, HSMI for his constant support and valuable comments on this collaborative research study.

NIUA duly acknowledges the valuable inputs and support rendered by officials of the State Governments, Urban Development Agencies, Housing Boards, Parastatals and Urban Local Bodies during the study tours to Raisen (Madhya Pradesh) and Kurseong (West Bengal). We acknowledge the support of Mr. V.T. Subramanian, Regional Chief, HUDCO, Bhopal, Mr. Anil Barve, Manager (Projects), HUDCO, Bhopal, Mr. Suresh Kumar Mishra, Regional Chief, HUDCO, Kolkata, and Mr. Debesh Chakrabarty, DGM (Projects), HUDCO, Kolkata. Thanks are also due to Mr. P.K. Sahu, Mr. Kailash Kumar and Mr. Saurabh Sood of Raisen Municipality, and Mr. Samir Dip Blon, Chairman and Mr. Govind Prasad Adhikari of Kurseong Municipality.

We deeply acknowledge the efforts of the research team of NIUA in completing this study. We are grateful to the designing team of NIUA for designing the report. Finally, special thanks to Prof. Jagan Shah, Director, NIUA for his encouragement and constant support.

Executive Summary

This study is the third in a series under the project "Status of Demography, Economy and Social Structures as well as the Status of Housing and Basic Infrastructure of the different sizes of urban settlements". The first report had concentrated on 53¹ metropolitan cities of India. The second report focused on analysis of Class I cities (population range between 0.1 million and less than 1 million) except those classified as metropolitan cities termed as non-metropolitan Class I cities of India. *This third report focuses on Towns of India (population less than 1 lakh).* It aims to undertake an in-depth analysis of the demography, socio-economic indicators, and basic infrastructure in UAs/towns with populations of less than 1,00,000, studying their size class variations. The study has dealt separately with the status of slums in towns and status of census towns in detail.

The report is divided into seven chapters. Chapter 1 outlines the aims and objectives of the study. Chapters 2, 3 and 4 are focused on the demography, basic infrastructure and socio-economic analyses of towns in India. Chapter 5 deals with case studies of two similar sized towns, namely, Raisen in Madhya Pradesh and Kurseong in West Bengal. The case studies attempt to compare these two towns with respect to their demography, economy, status of basic infrastructure, housing and social indicators. Chapter 6 deals with the status of census towns and statutory towns. The policy conclusions that emerge from the analysis are presented in Chapter 7. Also, the towns have been categorised in terms of their status of basic infrastructure for informed decision making/informing policy.

The study came up with the following findings:

- The concentration of urban population in towns has been decreasing since 1961 while their numbers have been constantly increasing. In 1961, 48.1 per cent of the urban population resided in towns, whereas in 2011, the share came down to 29.8 per cent. On the contrary, there has been an increase in number of towns from 2223 to 5705 during the same period. Also, during the last decade (2001-2011) urban population living in the metropolitan cities of India has increased from 37.8 to 42.3 per cent, with a corresponding decline in the non-metropolitan Class I cities (from 30.8% to 27.9%). This corroborates the fact that India has a top-heavy urban structure. However, when towns which are constituents of UA are taken into consideration, the share of towns in urban India increases to 42 per cent.
- The addition of 2530 new census towns has contributed to the increase in the level of urbanization in the country. Inclusion of these towns has resulted in the addition of 26.8 million people in settlements which experienced in-situ urbanization as a result of increase in population, density and sectoral diversification. This point to a reduction in the contribution of migration, natural increase and expansion of existing

¹ The first year report has considered 53 metropolitan cities based on Census of India Provisional Population figures, 2011. However, as per the Final Population Tables 2011, Chandigarh was reported to have a population less than 1 million. Therefore, the number of metropolitan cities is now 52.

urban boundaries to urbanization. A deduction of the incremental population of census towns brings down the level of urbanisation to 28.9 per cent and urban growth rate to 2.02 per cent.

- Among towns, in 2011, the highest concentration of population is found in Class V towns followed by smaller size classes. In 2011, the proportion of population decreased in Class II, Class III and Class IV towns (though the number of towns increased), and increased in lower order towns, i.e. Class V and VI.
- The towns in India have registered a slow growth rate at 2.25 per cent as compared to the development of urban India, metropolitan cities and Class I cities. Metropolitan cities during the last decade registered a significant growth rate of 3.88 per cent. The growth rate of Class I cities and urban India during the same decade was 2.99 per cent and 2.76 per cent respectively. The growth rate among the various size classes of towns during the decade 2001-2011 systematically increases with the decreasing order of towns – reaching the highest in Class VI towns. The growth rate in Class II, III and IV towns is lower than urban India (2.76%) and towns as a whole (2.25%). Though the Class III category experienced a slow growth rate, it added the highest number of people in absolute terms (6.7 million), whereas Class VI category, which experienced the highest growth rate of 9.22 per cent, added only 1.6 million people in absolute terms.
- Out of 5,705 towns, 53 UAs/towns reported a population above 90,000. These towns can be categorised as “potential Class I cities” The top three in this group of towns are Lakhisarai (Nagar Parishad) in the state of Bihar, with a population of 99,979, followed by Auraiya UA in Uttar Pradesh, with a population of 99,674, and Khambhat UA in Gujarat, with a population of 99,164.
- Among the various size class levels, not much difference is seen in the average household size in 2011. The decade 2001-2011 witnessed a decline in the average size of households from 5.3 to 4.8 in towns. Census of India 2011 reports the average household size to be declining in all classes of cities and towns in India.
- The towns of India have an overall sex ratio of 939 which is lower than the national average but higher than that of urban India. Among the Class II to Class VI size classes of towns, the highest sex ratio of 942 is observed in Class II and Class V categories.
- The child sex ratio of towns is 912 which is better than urban India. At the size class level of towns, Class II and III have the lowest sex ratio of 912. The ratio improves with the decreasing order of towns.
- All the size classes of towns have shown improvement in literacy rates between 2001 and 2011. The female literacy rate has increased at a higher rate as compared to male literacy rate in all size classes of towns. In 2011, towns reported a literacy rate of 80.2 per cent which is lower than urban India. In 2011, the highest literacy rate is observed in Class VI towns (82.5%) followed by Class II towns (80.9%).
- There is not much variation in work participation rate across various size classes of towns. During 2001-2011, the WPR has seen an increasing trend in all the size classes of towns, as well as in the case of both male and female participation rates. The WPR in towns is 35.0 per cent which is at par with urban India. At a gender disaggregated level, female WPR in towns is only 16.2 per cent whereas the male participation rate is 52.6 per cent.

- Three-fourths of the working population is engaged in the tertiary sector (74.9%). The share of cultivators declined marginally with a simultaneous increase of agricultural labourers in small towns during 2001-2011, reflecting immiseration of their economies. It is important to note that there is a higher share of male workers in other services as compared to their female counterparts, especially in small towns. Higher female participation is observed in the category of household workers. An in-depth analysis across the various size classes of towns reveals that the share of cultivators and agricultural workers is lowest in Class II towns as compared to other size classes of towns. The highest proportion of cultivators and agricultural labourers was observed in Class IV towns followed by Class V towns in 2011. The share of household workers increases with the increase in size class except for Class VI which largely consists of industrial townships.
- The analysis of access to civic services brings out a strong relationship between the size of the city/town and availability of civic services. The access to tap water is higher in larger towns as compared to smaller towns. The dependence on ground water increases with the decreasing size class order of towns. The highest proportion of households having access to safe drinking water is in Class II towns (82.0%) and lowest is in Class VI towns (74.5%).
- There is a variation in terms of access to toilets at the size class level. In Class II towns, 82.1 per cent of the households have access to toilets. This proportion decreases further with only 65.7 per cent of households having access to toilets in Class V. Only 66.8 per cent of the households in Class II towns, 58.4 in Class III, 50.8 in Class IV and 45.3 per cent in Class V towns are reported to be connected to flush/pour flush toilets. Overall, towns are largely dependent on septic tanks (43.91%) and the proportion of households connected with piped sewers is only 11.17 per cent.
- There are only 32 towns in India where all the households have access to toilets and among them in 19 towns, all households have toilets within their premises. There are only 29 towns in India which can be termed as open defecation free (ODF) towns.
- In all towns, 70.3 per cent of the households have a drainage system of which only 21.9 per cent are connected to closed drainage. The waste water outlet is largely connected to open drainage in all the size classes of towns. At the size class level, 79.3 per cent of the households in Class II have access to drainage (open or closed) facilities. The proportion reduces to 73.3 per cent in Class III, 64 per cent in Class IV, 54 per cent in the Class V and VI categories.
- In 2011, there were 13.7 million slum households in the country accounting for 17.4 per cent of the total households. The slum population is largely concentrated in Class I cities (73.5%). The share of slum population residing in towns is only 26 per cent.

The main challenges and possible policy implications that arise from the analysis of towns are as follows:

- Almost all studies on economic growth, structural transformation, employment, poverty, basic infrastructure, housing, and social sector attainment levels have inevitably looked at 'urban' as a single entity, thus overlooking the huge differences that exist between small towns, medium towns and large metropolitan cities. The urban system is very heterogeneous in India. In India, it includes 7,933 settlements with populations ranging from just 5 to as large as 18 million.

- Towns are visibly deficient in access to services. The current service levels are extremely low. The cumulative gap of urban service delivery in the past has to be compensated by larger investments in the coming decades.
- HUDCO is already funding housing and infrastructure projects in several towns. However, given the acute housing shortage among the economically weaker sections and low income group categories, the efforts of the government / HUDCO may be stepped up for creation of more affordable housing stock in these towns with a focus on the poor. Investments should be geared towards improving access to basic services as well.
- Adequate policy measures are required to be taken to make these towns efficient and productive. These will have a spill-over effect on the surrounding rural hinterland as well.
- The census towns, although “urban” by definition are actually overgrown villages which have undergone sectoral diversification. These need to be converted to statutory towns by respective state governments. Also, these settlements, which are essentially rural in character, are more agriculture based with poor civic amenities and low levels of socio-economic development. Adequate policy focus should be drawn to these towns which have been classified as urban for the first time. In fact, the green field smart city initiatives could be tried out in towns where the population is small and therefore, infrastructure investments could be planned out using smart technologies.
- The towns suffer from lack of data on housing. Also, GDP figures of these urban centres are not available. The same is true for data on economic base of these towns. These deficiencies have been major limitations of the study.

The HUDCO Chair collaborative project at the NIUA aims to undertake an in-depth analysis of the demography, economy and social structures as well as the status of basic infrastructure and housing of the different size classes of urban settlements. The first year report had concentrated on the metropolitan cities of India. The second year focused on analysis of all Class I cities (population range between 1 lakh and 10 lakh) except those classified as metropolitan cities termed as non-metropolitan Class I cities of India. The third year report focuses on analysis of Towns of India (population less than 100,000). The present report comprises a detailed analysis on sectors as enumerated below:

1. Demography

2. Basic Infrastructure and Slums

3. Social and Economic Condition

4. Census Towns

In addition, case studies of two towns, namely, Raisen and Kurseong have been conducted as a part of the research study. This has been done to analyse the demographic, economic and social structures as well as status of basic infrastructure in these towns in detail. The policy implications emerging from this study would help the government in taking informed decisions on various facets of urban development.

Chapter 1

Introduction

Cities across the globe are becoming increasingly interlinked and dependent upon each other to promote local economic development and attract trade and investment. Functionality and linkage to global, regional and national networks of trade, knowledge, competitiveness and investment now have a significant impact on the status and functioning of cities within global and national urban systems. Importantly, however, it is a system of secondary cities and small towns (cities that play a key role in supporting the development of sub-regional and sub-national economies) that are expected to have a greater influence upon the economic development of nations and larger geographic regions in the future. The role played by systems of secondary cities and small towns in shaping the geography of urban systems, especially in developing countries, is not well analysed although their role in supporting national or regional development is acknowledged to be important. However, many small towns are struggling to manage urbanisation, attract investment and meet the demand for housing, infrastructure and basic urban services. Many of the problems that have become associated with mega and large metropolitan regional economies in developing countries are manifesting themselves in these towns. Globally, there is a growing gap in levels of socio-economic development between small towns and primary cities. The growing disparities have a significant consequence on regional development in general and inclusive development of urban areas in particular.

Moreover, there is very poor data and information available on the economy, land, finance, infrastructure and governance of this category of towns and cities. This situation is severely affecting their capacity to plan and manage urban development and promote employment and economic growth. This is particularly true for Asian countries and India is no exception. Roberts (2014) has identified three broad types of secondary city economies emerging globally: 'lead', 'lagging' and 'laggards'. Most of the towns and cities fall into the latter category and are located in sub-Saharan Africa and Asia. These cities are largely driven by population growth and consumption. Most are poorly managed, have weak infrastructure, poor communication systems within and between cities, and are not very competitive.

At the global level, increasingly, urban growth is being influenced by continued global economic integration and struggle among economies and individual cities to be competitive in the global marketplace. Managing overall urban growth has increased in both scope and complexity. It has become one of the most important challenges as well as one of the greatest opportunities of the 21st century. Historically, urbanisation has been driven by the concentration of investment and employment opportunities in urban areas. Productive activities in industry and services cluster in cities. As cities attract businesses and jobs, they bring together both the human and the entrepreneurial resources to generate new ideas, innovations and increasingly productive uses of technology.

According to McKinsey Global Institute (2011) estimates, 80 per cent of the world's gross domestic product (GDP) is being generated in urban areas. It also estimated that the urban economic mass is even more concentrated, with the top 600 cities producing about 60 per cent of the global GDP, and the top 100 contributing about 38 per cent of the global GDP. The Global Metro Monitor (Brookings Institution 2010) examined data on economic output and employment in 150 of the world's largest metropolitan economies, located in 53 countries, from 1993 to 2010, and concluded that though their per capita measures of Gross Value Added (GVA) range widely, from under \$1,000 in Hyderabad and Kolkata, India, to roughly \$70,000 in San Jose, U.S.A. and Zurich, Switzerland, what is consistent about these metropolitan areas is their function as locations for high-value economic activity in their respective nations and world regions. Nearly 80 per cent boast average incomes that exceed averages for their nations. The 'metro edge' is found to be particularly large in rapidly emerging economies such as Eastern Europe, Asia, Latin America, and the Middle East, where the income in major metros exceeds national incomes by average margins of at least 80 per cent. As a result, these metropolitan areas figure above the national and global levels. In 2007, they accounted for just fewer than 12 per cent of global population, but generated 46 per cent of world GDP.

Thus, all over the world, there are evidences of increasing concentration of population in the metropolitan areas; and economic mass in the densest urban centres is getting concentrated as well. The trend is expected to continue in the future. This is because the urban centres (more so the metropolitan cities) offer economies of scale in terms of productive enterprise and public investment. Concomitant to the growth of large cities, one finds increase in the growth of urban peripheries. This growth in most metropolitan peripheries is a result of in situ urbanisation where sectoral diversification results in the emergence of new towns in peri-urban areas.

India is an integral part of the urban transformation that the world is witness to, and is gradually making the shift from 'rural' to 'urban', at a much slower pace than other developed nations, mainly due to the 'low base' effect in urbanisation levels. India, in 2011, was 31.2 per cent urban, and 377.2 million people lived in urban India. But India was already home to 11 per cent of the world's urban population in 2011, which is estimated to rise to 15 per cent by 2050. Also, projections indicate that India would achieve 'the tipping point' of 50 per cent urban by 2050. Thus, India is projected to be more 'urban' even before the next 30 years. If not well managed, this inevitable increase in India's urban population will place enormous stress on the system.

The urbanisation scenario that has emerged in India in 2011 is significant in terms of numbers and diverse in pattern. There is a clear break from past trends of urbanisation, both in pace and scale. A large number of new towns have come up in the decade 2001-2011. The new towns that have come up are mostly small census towns, which though urban in definition, are rural by governance. Available literature points to the growing suburbanisation and peripheralisation of urban areas.

Almost all studies on economic growth, structural transformation, employment, poverty, basic infrastructure, housing, and social sector attainment levels have inevitably looked at 'urban' as a single entity, thus overlooking the huge differences that exist between small towns, medium towns, and large metropolises. The urban system is very heterogeneous all over the world as it is in India. In India, it includes 7,933 settlements with populations ranging from just 5 million to as large as 18 million.

Studies looking at the intra-urban differentials and their impact on the growth processes for India have been very few, but some have surfaced in the last two years. Ghani et al (2012) points out that enterprises and

jobs are concentrated in big cities. Krishna and Bajpai (2011), using NCAER household data, noted that the distribution of benefits from economic growth in India since the mid-1990s has followed an identifiable spatial pattern. People in the largest cities have achieved the greatest gains (in terms of inflation-adjusted per capita incomes) followed by people in small towns and in villages located close to towns. World Bank (2013) notes that 8 per cent of national employment is in the first ring within 50 kilometres from seven megacities. The suburbs and peripheries are gaining industry, while metropolitan cores are de-industrialising. Denis et al (2012) showed an employment shift towards metros during the period 1993-94 to 2009-10, except for construction, which has moved to smaller cities and rural areas. Despite the shift, metros still accounted for less than half, and often less than a third of urban employment in all the sectors, including services. Desmet et al (2012) pointed out that the spatial evolution of India continues to favour districts with high levels of employment density, more so in high-tech service industries, such as the computer and business services sectors, and these high density clusters of economic activity continue to be India's engines of growth.

In India, the pattern of urbanisation is oriented towards the large cities. There has been continuous concentration of population in Class I cities (cities with one lakh population and above). According to Census of India 2011, 70.1 per cent of the urban population is concentrated in this size class. One of the reasons for increasing dominance of these cities is the graduation of lower order towns into the Class I category and even within this category, the metropolitan cities (cities with one million and above) have shown a significant increase in terms of number and population growth. As per a McKinsey report, India is at the threshold of an urban flare-up. The population of Indian cities is expected to increase (from 340 million in 2008) to 590 million by 2030. In the 2030s, India's largest cities are projected to be bigger than many major countries.

There is a direct relationship between the size of a city, its economic growth and level of civic services. Economic growth leads to in-migration which puts additional stress on delivery of infrastructure services; on the other hand infrastructure development facilitates economic growth to maximise economies of scale. The large cities attract investments but are unable to bring about commensurate improvement in the provision of basic services like water supply, sewerage, solid waste management, urban transport, affordable housing for various sections of the urban population. For this reason, they are at the forefront of the urban challenges.

The government has announced several missions and programmes for urban development, namely, Pradhan Mantri Awas Yojana, Swachh Bharat Mission (SBM), Heritage City Development and Augmentation Yojana (HRIDAY), Atal Mission for Rejuvenation and Urban Transformation (AMRUT), and Smart Cities Mission.

The Pradhan Mantri Awas Yojana (2015-2022) aims to provide central assistance to Urban Local Bodies (ULBs) and other implementing agencies through states/UTs for: in situ rehabilitation of existing slum dwellers using land as a resource through private participation, credit linked subsidy, affordable housing in partnership, and subsidy for beneficiary-led individual house construction/enhancement.

The scheme will cover entire urban areas consisting of 4041 statutory towns with the initial focus on 500 Class I cities in three phases. The credit linked subsidy component of the scheme would be implemented across the country in all statutory towns right from the beginning. In the spirit of cooperative federalism, the mission will provide flexibility to the states for choosing the best options amongst four verticals of mission to meet their demand for housing. The process of project formulation and approval in accordance with the mission guidelines would be left to the states so that projects can be formulated, approved and implemented faster.

A Technology Sub-mission under the PMAY Mission would be set up to facilitate adoption of modern, innovative and green technologies and for building material for faster and quality construction of houses. The Technology Sub-Mission will also facilitate preparation and adoption of layout designs and building plans suitable for various geo-climatic zones. It will also assist states/cities in deploying disaster resistant and environment friendly technologies.¹

Under the Swachh Bharat Mission all statutory towns will be covered. The objectives of the Mission are elimination of open defecation, eradication of manual scavenging, modern and scientific solid and liquid waste management, and creating awareness about sanitation along with its linkage with public health by 2nd October 2019. The objective of HRIDAY is to preserve and revitalise the unique character of a heritage city and facilitate inclusive heritage-linked urban development, including sanitation, security, heritage revitalisation, livelihoods by exploring various avenues including involvement of the private sector. HRIDAY will focus on 12 heritage cities, namely, Ajmer, Amravati, Amritsar, Badami, Dwaraka, Gaya, Kanchipuram, Mathura, Puri, Vellankanni and Warangal. The Smart Cities Mission aims to promote cities that provide core infrastructure and give a decent quality of life to their citizens, a clean and sustainable environment and application of 'smart' solutions. The focus is on sustainable and inclusive development and the idea is to look at compact areas, create a replicable model which will act like a lighthouse to other aspiring cities. AMRUT aims to provide basic services (e.g. water supply, sewerage, urban transport) to households, and build amenities in cities which will improve the quality of life for all. The mission will cover 500 cities and towns focusing on basic urban infrastructure and bringing in good governance through reforms and capacity building. Cities will have to prepare a Comprehensive City Development Plan. The launch of the above Missions does bring to the forefront the priorities of the government in ensuring adequate and equitable access to housing and basic amenities to all city dwellers.

Recent reports suggest that India spends \$17 per capita per year in urban infrastructure, whereas the most benchmarks suggest a \$100 requirement. The investment required for building urban infrastructure in India over the next 20 years is estimated at approximately US \$1 trillion. As per Census of India 2011, only 51.4 per cent of households in the non-metropolitan cities have treated tap water facility within their premises; just 28.2 per cent have flush latrines with piped sewers, though 84.5 per cent have some sort of latrine facility within their premises. The situation in metropolitan cities is better than the non-metropolitan cities where 60.0 per cent of the households have access to safe drinking water. This clearly brings out the direct linkage between the size of city and level of civic services. The poor economic prospects of small and medium-size cities and low quality infrastructure services have kept them at sub-optimal levels of growth. This sub-optimality has been a hindrance in accessing institutional funds. Kundu and Samanta (2011) stated that even the fund disbursal pattern of Jawaharlal Nehru National Urban Renewal Mission (JNNURM), the flagship urban development programmes, brings out the big-city bias and a move towards polarised development. There exists a wide disparity in the availability of institutional funds to large and small cities as a result. Also, Kundu and Sarangi (2005) point out that there is an inverse relationship between poverty rates and the size of towns, with the poverty rate in large cities (one million plus) at 14.2 per cent and in small cities at 24.2 per cent in 1999-2000.

Need for the Study

In view of the above, it would be important to come up with a clearer understanding of the trend of urbanisation, levels of the social indicators, basic infrastructure and state of slums so as to provide a comprehensive story on the state of towns (urban centres below one 100,000 population) in India at the size class level. This would help in addressing the knowledge gap, aid the process of informed decision making, and help formulate a stratified urban policy geared towards meeting the needs of towns. Though studies have tried to address the above mentioned issues there is a lack of focus on the size-class differentials of cities and towns.²

Objectives of the Study

The objectives of this research study are as follows:

- Analyse the demographic and socio-economic trends including the status of basic infrastructure and slums in urban centres below one 100,000 population including UAs
- Analyse variations and inequities that exist across urban centres below one 100,000 population
- Identify towns which need investment in basic amenities
- Study the emerging socio-economic dynamics of the census towns vis-a-vis statutory towns.

Focusing on urban centres below 100,000 population of India, their significance and inequities, and how different are the trends thereof from the trends evident in metropolitan India, urban India, rural India and India as a whole, many important questions emerge and call for a detailed analysis. These questions are outlined at the end of this section.

Structure of the Report

This report presents the state of urban centres below 100,000 population focusing mainly on demography, economy, social indicators and the basic infrastructure scenario. The 2011 Census did not publish housing data for towns below 100,000. Also, data on economic indicators like monthly per capita income, poverty and industrial classification of workers is not available for these towns. As a result, these aspects could not be studied for towns. The report is structured in seven sections. The first chapter gives the introduction to the study. The second chapter presents the demographic profile of the towns. It analyses levels and trends of urbanisation in towns. The level of basic services in towns and the state of slums have been detailed out in chapter 3, while socio-economic indicators have been dealt in chapter 4. Chapter 5 presents a case study of two towns. Chapter 6 deals with the detailed analysis of census towns vis-à-vis statutory towns. The last section of the study presents the conclusion and policy implications of the study.

² In fact, internationally too, such studies have been few. Krugman (1990) had noted that the subject of the size distribution of cities the world over has been neglected by development economists.

The Questions

The study attempts to analyse the available evidence on towns, and tries to answer the questions outlined below.

1. What is the current rate of growth in towns and how is this rate changing over time? How different is this rate from those of the other size classes of cities and towns, and for urban India? Are small towns growing faster than cities in terms of number and population? How do they differ amongst themselves?
2. Is there an increasing concentration or is urbanisation being more evenly spread out?
3. How do the social indicators differ amongst size class of towns, urban India, rural India, and India as a whole? How do they differ amongst themselves?
4. How do the work participation rates (male, female and total) in towns differ from those in urban India, rural India and India as a whole? Has the gender gap in work participation rates increased or decreased in towns over time?
5. How different is the status of basic services in towns from those in urban India, rural India, and India as a whole? How do they differ amongst themselves?
6. What is the gap between access of basic services amongst the towns themselves?
7. Which town has the maximum coverage of basic services, and which one the worst?
8. How significant are slums in towns, relative to those in Class I and urban India? How does the proportion of slum households differ amongst the towns?
9. What is the current rate of growth in census towns and how is this rate changing over time? How different is this rate from statutory towns and for urban India? How do census towns differ amongst themselves?
10. How do the social indicators differ amongst census towns and statutory towns as a whole? How do they differ amongst themselves?
11. How do the work participation rates (male, female and person) in census towns differ from those in statutory towns? Has the gender gap in work participation rates increased or decreased in towns over time?
12. How different is the status of basic services in census towns from those in statutory towns? How do they differ amongst themselves?

Chapter 2

Demography

As per the Population Census of India 2011, there are 7,933 individual cities and towns in India. This includes 4,041 statutory towns and 3,892 census towns. There are 474 urban agglomerations (UAs) and 981 outgrowths. If urban agglomeration is taken as a unit, there are 6,173 cities and UAs in India. Based on the size of population, the Census of India groups cities and towns into six size classes from Class I to Class VI (Box 2.1). The urban areas which have a population above one lakh are termed as cities while those which have a population less than one lakh are termed as towns. In this report, the term town signifies all urban centres below 100,000 population.

This chapter analyses the demographic profile of Indian towns which have a population of less than one lakh and includes size classes II to class VI. In 2011, there were 5,705 towns/UAs in India which fall within this category. These 5,705 towns/UAs also include 2,468 census towns.

Out of the 5,705 towns, there are 176 UAs and 5,529 individual towns. The 5,529 individual towns include 1 municipal corporation (M Corp), 538 municipalities (Ms), 326 municipal councils (MCIs), 124 municipal committees (MCs), 25 Municipal Boards (MBs), 22 city municipal councils (CMCs), 16 cantonment boards (CBs), 29 nagar parishads, 1,007 nagar panchayats (NPs), 142 nagar palika parishads (NPPs), 64 notified area committees (NAC), 48 notified towns (NTs), 87 town municipal councils (TMCs), 76 town committees (TCs), 535 town panchayats (TPs), 15 industrial notified areas (INAs), one industrial township (ITS), 3 notified areas (NAs), and one small town committee (STC). In addition, there are 2,469 census towns (CTs) detailed in annexure 7.

There are 176 UAs which include 2 municipal corporations (M Corp), 217 municipalities (Ms), 24 municipal councils (MCIs), 6 municipal committees (MCs), 6 municipal boards (MB), 4 city municipal councils (CMCs), 40 cantonment boards (CBs), 9 nagar parishads, 34 nagar panchayats (NPs), 30 nagar palika parishads (NPPs), 7 town municipal councils (TMCs), 2 town committees (TCs), 94 town panchayats (TPs), 7 notified area committees (NACs), 11 industrial notified areas (INAs), 8 industrial townships (ITSs), 2 notified areas (NAs), one gram panchayat (GP), and 1,404 census towns (CTs).

The number of UAs/towns in India has gone up from 2,223 in 1961 to 5,705 in 2011 – an increase of about 157 per cent (Table 2.1). The highest increase in number of towns was in the recent Census decade (2001-2011) when the number of towns increased by 1,721. The metropolitan cities/UAs of India have increased from 35 to 52 and the non-metropolitan Class I cities from 359 to 416. Among the 5,705 towns, there are 176 UAs and 5,529 individual towns in 2011 in the same decade.

Box 2.1: What is 'urban' in India?

Urban settlements in India consist of:

Statutory towns: All places with a municipality, corporation, cantonment board or notified town area committee as declared by the state law.

Census towns: Places which meet the following criteria:

- a minimum population of 5,000;
- at least 75 per cent of male working population engaged in non-agricultural pursuits;
- a population density of at least 400 persons per square kilometre.

'**Cities**' are 'urban areas' with a population of at least one lakh (0.1 million). The others are termed as '**Towns**'.

'**Metropolitan cities**' are defined as those with a population of at least 10 lakh (1 million).

'**Urban agglomerations**' (UAs) are defined as continuous urban spreads constituting a town and its adjoining urban outgrowths (OGs) or two or more physical contiguous towns together and any adjoining urban outgrowths of such towns. A UA must consist of at least one statutory town, and its total population of all constituents put together should not be less than 20,000 as enumerated in the Census of 2001.

Size Class Classification (population)

Class I: 100,000 and more

Class II: 50,000 to 99,999

Class III: 20,000 to 49,999

Class IV: 10,000 to 19,999

Class V: 5,000 to 9,999

Class VI: Less than 5,000

The analyses in this report on city size-class distribution have been carried out taking towns and UAs as opposed to individual towns and cities as units. Therefore, in this report, the urban frame will constitute 6,173 UAs and cities/towns, and not 7,933 cities and towns. Class I cities have a population above 1,00,000 (0.1 million). Class I cities are subdivided into three size-class categories: IA, IB and IC. Class IA are cities with a population above 5 million (also referred to as the megacities, as opposed to the United Nations classification of 10 million plus cities as megacities); Class IB cities are those with a population between 1 and 5 million, and Class IC cities are those with a population between 0.1 and 1 million (non-metropolitan Class I cities). Class IA plus Class IB cities together define metropolitan cities. Towns are the sum of Class II, Class III, Class IV, Class V and Class VI towns, i.e. those with population of less than 1,00,000.

While there has been an increasing concentration of urban population living in the metropolitan cities of India – the percentage increasing from 37.8 to 42.3 per cent in 2001-2011 – the proportion of urban population

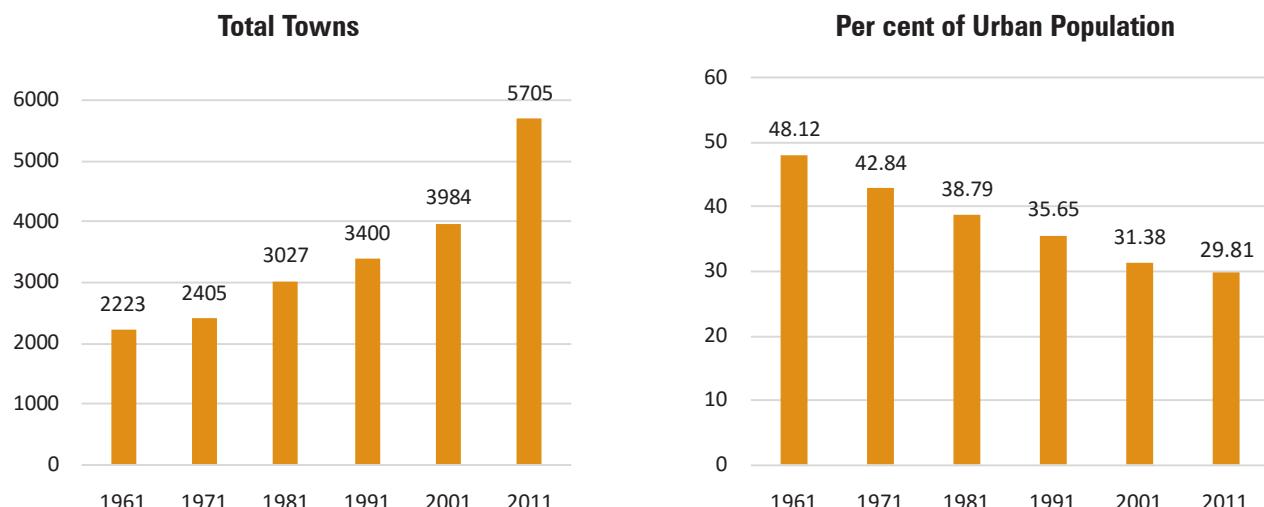

in non-metropolitan India and towns of India has declined during the same decade. The proportion of urban population in towns of India has decreased from 31.38 per cent to 29.81 per cent though the numbers have gone up by 1,721 during the decade 2001–2011 (Chart 2.1). Until 1991, towns had accounted for a higher share of urban population as compared to metropolitan and non-metropolitan Class I cities. During the last two decades the concentration of urban population has been more in metropolitan cities/UAs. The proportion of population in towns/UAs has decreased from 48.1 per cent in 1961 to 29.8 per cent in 2011, whereas in metropolitan cities the same has increased from 23.6 per cent in 1961 to 42.3 per cent in 2011.

Chart 2.1 also shows that the concentration of urban population in towns has been decreasing since 1961 while the numbers have been constantly increasing. In 1961, 48.1 per cent of the urban population resided in towns, whereas in 2011, the share came down to 29.8 per cent. On the other hand, there has been an increase in number from 2,223 to 5,705 during the same period.

This is a pointer towards the top-heavy structure of spatial distribution of the urban population in India, wherein most of the urban population is increasingly being concentrated in the bigger cities. In terms of the absolute addition to the population, between 2001 and 2011, the towns added 22.6 million to their population, whereas the non-metropolitan Class I cities have added 17.0 million and metropolitan cities have added 51.4 million. Thus, out of the 91.0 million net addition to the urban population in the past decade, the share of towns was only 24.9 per cent. The remaining 68.4 million or 75.1 per cent of the population growth was in 468 Class I cities alone. The 52 metros account for 56.4 per cent of the net addition, while the non-metropolitan Class I cities account for 18.7 per cent.

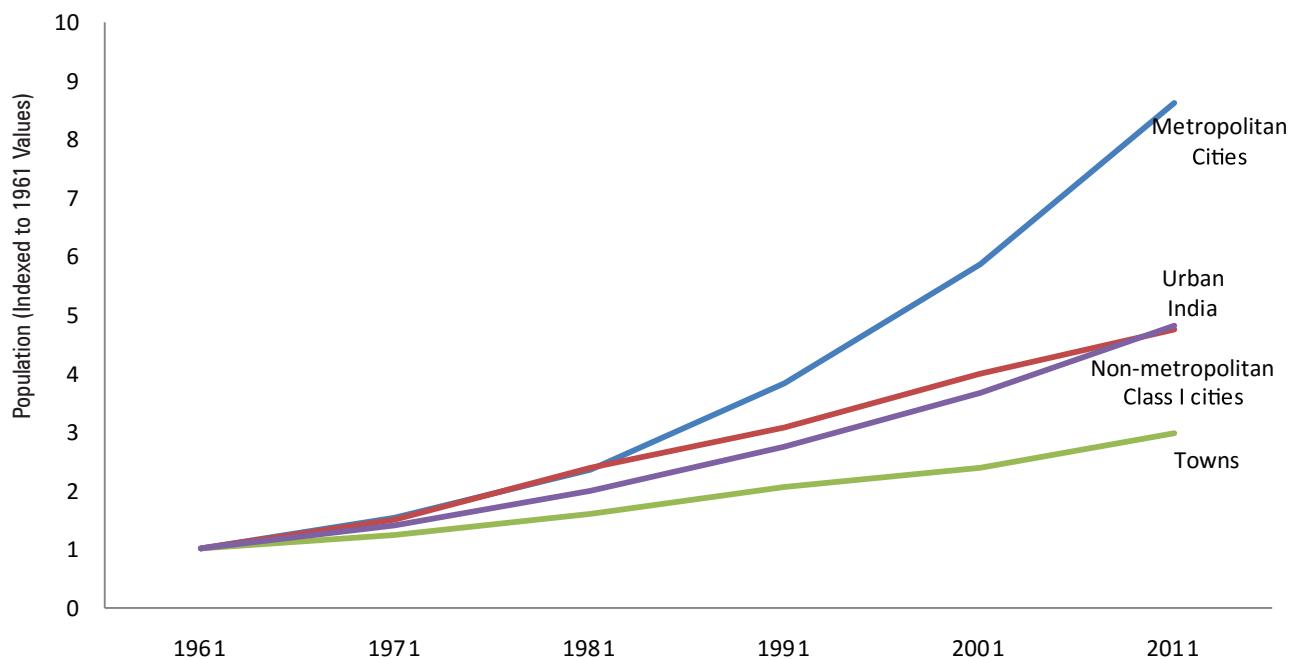

Chart 2.2 provides a visual representation of population growth in the towns, non-metropolitan Class I cities, metropolitan cities and urban India, indexed to 1961 values, which reveals that towns are growing at a slower pace as compared to metropolitan cities, non-metropolitan Class I cities and even urban India as a whole.

**Chart 2.1: Towns in India: Numbers and Population
(per cent of urban population) during 1961—2011**

Source: Calculations based on Census of India data for various years

Chart 2.2: Population in the Urban India, Metropolitan Cities , Non-Metropolitan Class I Cities, Towns and: Indexed to 1961 Values

Source: Calculations based on Census of India data for various years

Table 2.1 shows that the number of cities/UAs in Class I cities (+100,000) is small (468), but is steadily rising. But what is noticeable is that the number of cities in Class IB and towns has grown faster than the rest. The number of cities in Class IA has increased from 6 to 8, and that in Class IB has gone up from 29 to 44 during the decade 2001–2011. The number of class IC or non-metropolitan Class I cities and towns has been rising steadily from 1961. The non-metropolitan Class I cities have increased from 100 in 1961 to 416 in 2011. Likewise, the number of towns has increased substantially from 2,223 in 1961 to 5,705 in 2011. The 468 Class I cities alone accounted for 70.2 per cent of the country's urban population in 2011; it was 68.6 per cent in 2001. The rest of the 5,705 UAs and towns of India account for only 29.8 per cent of the urban population, pointing to the growing concentration of urban population in higher order cities (Table 2.2).

Chart 2.3 lists out the 20 largest towns of India, as per the population size in 2011. Out of 5,705 towns, 53 towns have a

Table 2.1: Number of Cities and Towns Across City Size Class: 1961–2011

Year	Metros			Non-metropolitan Class I cities	Total Class I	Towns	Urban India
	Class IA	Class IB	Total				
1961	1	6	7	100	107	2,223	2,330
1971	2	7	9	143	152	2,405	2,557
1981	3	9	12	207	219	3,027	3,246
1991	4	19	23	276	299	3,400	3,699
2001	6	29	35	359	394	3,984	4,378
2011	8	44	52	416	468	5,705	6,173

Note: Class IA cities have a population above 5 million (megacities), Class IB cities have a population between 5 and 1 million, Class IC cities have a population between 0.1 and 1 million (non-metropolitan Class I cities). Class IA plus Class IB cities together define metropolitan cities; towns constitute Class II, Class III, Class IV, Class V and Class VI towns, i.e. those with a population below 1,00,000.

population above 90,000. These towns can be categorised as 'potential Class I cities'. The top three in this group of towns are Lakhisarai (Nagar Parishad) in the state of Bihar, with a population of 99,979, followed by Auraiya UA in Uttar Pradesh, with a population of 99,674, and Khambhat UA in Gujarat, with a population of 99,164. There are 424 towns which have a population of less than 5,000 and 16 towns with a population of less than 1,000.

Chart 2.4 shows the 20 smallest towns in India as per the population size in 2011. The smallest town in terms of population in Valia (Naldhari) industrial notified area is with only 5 inhabitants, followed by Gangotri (NP) with a population of 110 people and Vasna Borsad (INA) with a population of 166 people. Among the 20 least populated towns 10 are industrial notified areas.¹

Class I cities have been growing at a much faster rate than urban India and towns for all the Census years from 1961. The growth rate of metropolitan cities during the last decade has been significant at 3.88 per

¹ An area is declared as an industrial notified area to avoid the issue of multiple taxation on industries (such as tax and octroi of panchayats and service charges of a corporation) and to avoid the issue of multiple jurisdiction of one or more panchayats.

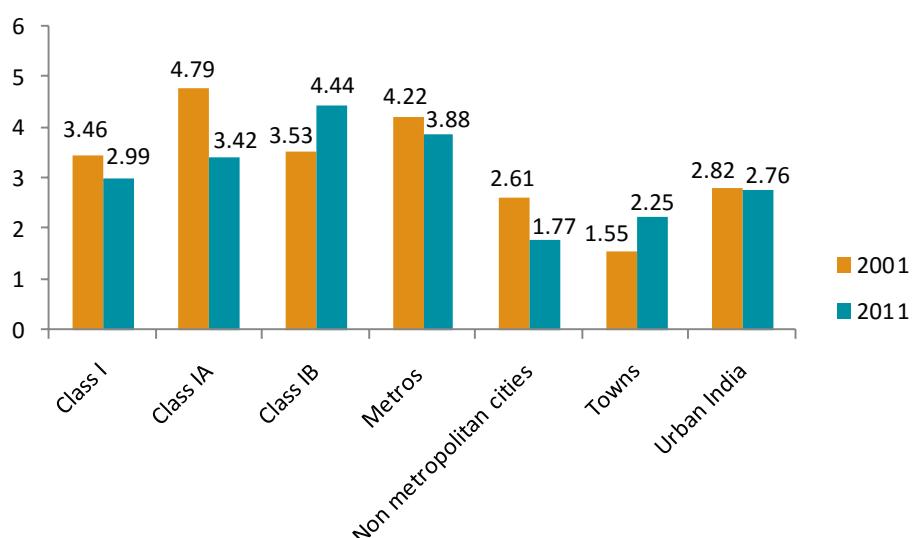

cent though it declined from 4.22 per cent during the decade 1991-2001. While the growth of the urban population was at the annual exponential growth rate (AEGR) of 2.76 per cent during the decade 2001-2011, that of the Class I cities and towns was at 2.99 per cent and 2.25 per cent respectively. While Class IA cities grew at 3.42 per cent, it was Class IB cities that registered the highest growth among all size classes of urban settlements at 4.44 per cent in the decade 2001-2011. The growth of Class IA cities also saw a decline from 4.79 per cent during the decade 1991-2001 to 3.42 per cent during the decade 2001-2011. The growth rate of the Class IB cities, on the other hand, registered an increase from 3.53 to 4.44 per cent. The annual exponential growth rate registered by the non-metropolitan Class I cities declined from as high as 4.50 per cent in 1981 (when it was the second fastest growing size category of cities and towns after Class IA) to just 1.77 per cent in 2011 and became the slowest growing size class. The towns have shown an increasing trend. The growth rate has increased from 1.55 per cent in 1991-2001 to 2.25 per cent in 2001-2011 (Table 2.3 and Chart 2.5).

Table 2.3: Annual Exponential Growth Rates Across Size Class of Cities and Towns: 1961-2011

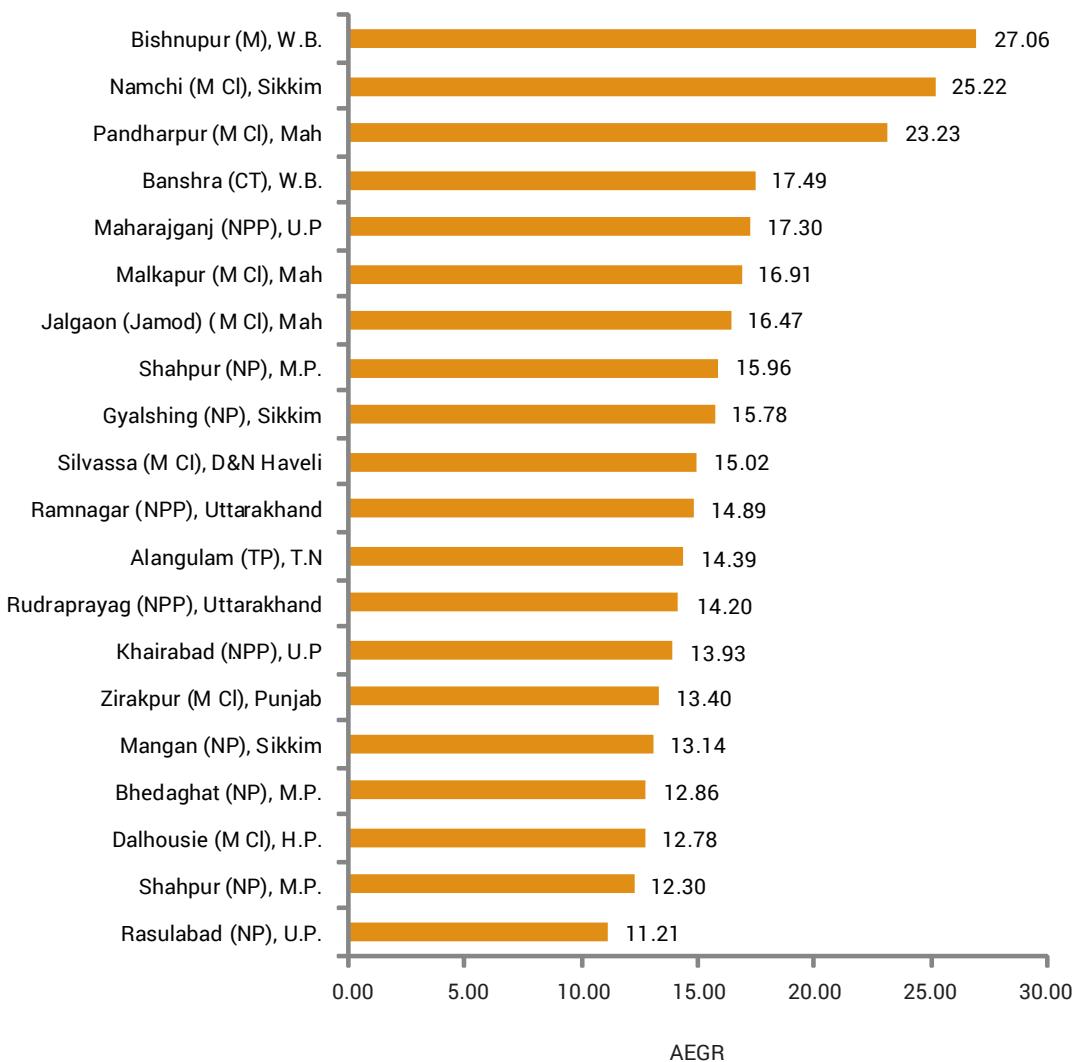

Year	Metros			Non-metropolitan Class I cities	Total Class I	Towns	Urban India	(per cent)
	Class IA	Class IB	Total	Class IC				
1961	0.00	0.65	4.58	3.12	3.76	1.01	2.34	
1971	8.49	1.44	4.31	4.11	4.20	2.07	3.23	
1981	5.53	2.72	4.20	4.50	4.37	2.69	3.68

Chart 2.5: Annual Exponential Growth Rates across Size Classes of Cities and Towns: 2001-2011

Source: Calculations based on Census of India, 2001 and 2011

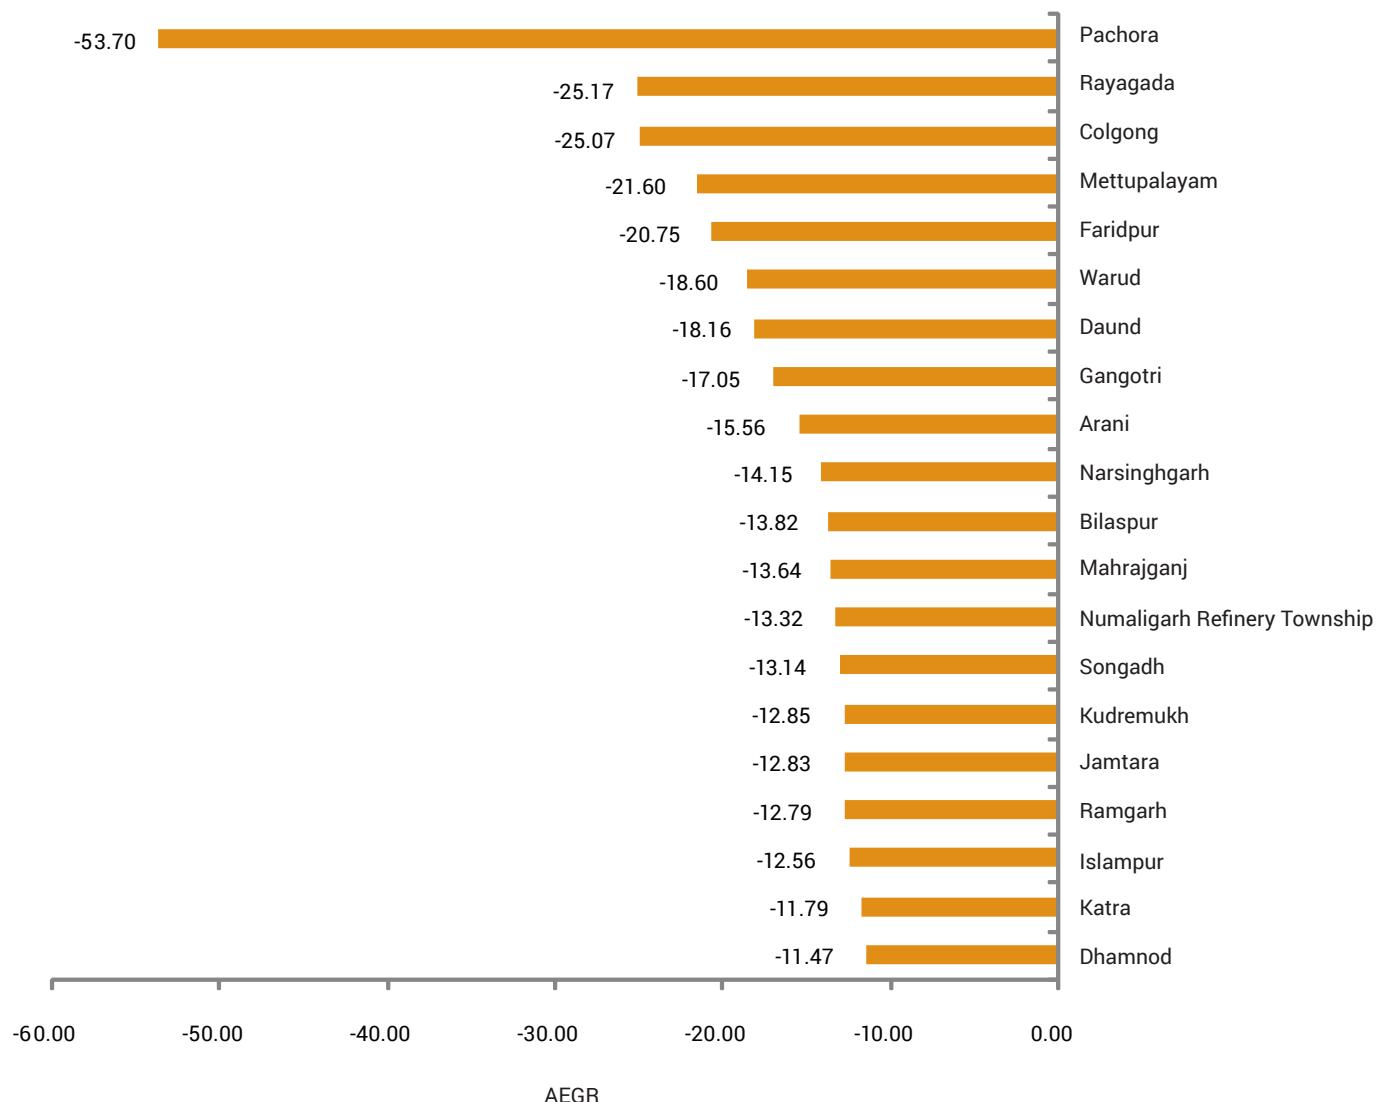

Chart 2.6: Twenty Fastest Growing Towns: 2001-2011

Source: Calculations based on Census of India data, 2001-2011

Chart 2.6 presents the 20 fastest growing towns in India during the period of 2001 to 2011. Bishnupur town in West Bengal registered the highest annual exponential growth rate of 27.06 per cent followed by Namchi town in Sikkim at 25.22 and Pandharpur in Maharashtra at 23.23 per cent. As many as 539 towns have experienced a higher growth than the average of towns (2.25%).

In contrast, chart 2.7 shows the 20 slowest growing towns in India in the decade 2001 to 2011. There are 390 towns that have recorded negative growth rates in the decade 2001-2011, of which 161 are census towns. The slowest growth rates have been recorded in Pachora in Maharashtra at -53.70 per cent followed by Rayagada in Odisha at -25.17 per cent and Colgong in Bihar at -25.07 per cent.

The number of towns has registered a steady rise since 1961. However, all classes do not follow the same pattern. The number of towns in size class II, III and IV show an increasing trend while Classes V and VI

Chart 2.7: Twenty Slowest Growing Towns: 2001-2011

Source: Calculations based on Census of India data for 2001-2011

which have populations less than 10,000 show a variation in their numbers. During the decade 2001-2011 the highest increase in number of towns was observed in the Class V category. The number of towns increased in this class from 879 to 1748, registering an increase of 869 towns. On the other hand, Class II category added only 70 towns. Classes III, IV and VI added 211, 339 and 232 towns respectively (Table 2.4).

The phenomenon of a top-heavy structure which was observed in Class I cities is non-existent in towns of India. In 2011, the highest concentration of population is found in Class V which has populations ranging from 5,000 to 9,999 followed by Class IV which has populations ranging from 10,000 to 19,999 (Table 2.5). In 2011, the proportion of population decreased in the higher order of towns, i.e. Class II, Class III and Class IV (though the number of towns increased), and it increased in lower order towns, i.e. Classes V and VI. Table 2.6 shows the towns with highest and lowest population in each size classes of towns.

Table 2.4: Number of Towns by Size Class: 1961-2011

Towns	Bishnupur (M), West Bengal (27.06%)	Pachora (Rural) (CT), Maharashtra (-53.70%)

Source: Calculations based on Census of India data, 2001-2011

The growth rate of towns during the decade 2001-2011 follows a hierarchical pattern. It systematically increases with the decreasing order of towns, reaching the highest in Class VI towns. The growth rate in Classes II, III and IV is lower than the average urban India (2.76%) and towns as a whole (2.25%). Though Class III category experienced a slow growth rate, it added the highest number of people in absolute terms (6.7 million), whereas Class VI category, which experienced the highest growth rate of 9.22 per cent added only 1.6 million people in absolute terms (Table 2.7 and Chart 2.8).

Chart 2.9 provides a visual representation of the increase in population across various size classes of towns, indexed to 1961 values. It reveals that the population in Classes V and VI is growing at a slow pace as compared to Class II and Class III. Also, it is interesting to note that there is an increase in population of Class V and VI towns in 2001-11 as compared to previous decades, while the increase in population in Class II and III towns reveals a decline during the same period.

Bishnupur town in West Bengal, which falls in Class II category, experienced the highest growth rate, while Pachora census town in Maharashtra, which falls in Class VI category, experienced the lowest growth rate of -53.70. Table 2.8 shows the highest and the lowest growth rate by size class.

Among the states in India, the largest number of towns is in Tamil Nadu (795) followed by Uttar Pradesh (709). Also, the highest number of urban population living in towns is found in the state of Uttar Pradesh (13.8%), followed by Tamil Nadu (12.3%). The details are provided in annexures 6 and 7 respectively. However, in terms of proportion of the urban population of states living in towns, only 34.7 per cent in Uttar Pradesh and 39.3 per cent in Tamil Nadu reside in towns (Annexure 1). In the state of Arunachal Pradesh, the entire urban population resides in towns as there is no Class I city. Similarly, the entire urban population resides in towns in the union territories of Dadra and Nagar Haveli, Daman and Diu and Lakshadweep. In contrast, the union territory of Delhi has only 0.1 per cent of the total urban population living in towns which is also the lowest among all the states/UTs.

The highest number of Class II towns is observed in Andhra Pradesh (62) and Class III in Uttar Pradesh (213). Himachal Pradesh, Goa, Manipur and Tripura do not have any towns in Class II category, while Sikkim, Andaman and Nicobar Islands, Chandigarh, Delhi and Lakshadweep do not have any towns in either Class II or Class III categories (Annexure 3).

In Class IV category, the highest number of towns is found in Tamil Nadu (316) while Delhi and Puducherry do not have any Class IV towns. The maximum number of Class V and VI towns is found in West Bengal (323 and 73 respectively). Puducherry is the only state which does not have any smaller order town while Chandigarh, Dadra and Nagar Haveli, Daman and Diu, Kerala and Meghalaya do not have any town with less than 5,000 population (Annexure 3).

The analysis in this chapter clearly brings out the top-heavy structure of the spatial distribution of urban population in India. The 468 Class I UAs and cities alone accounted for 70.2 per cent of the country's urban population in 2011. The rest of the 5,705 UAs and towns of India account for only 29.8 per cent of the urban population. Class VI towns belong to a special category. These are often industrial townships or cantonment boards, which explains a different development dynamics operating in these towns, akin to Class I cities. Here, the demographic growth rates are high, and access to basic infrastructure and overall socio-economic indicators are better as compared to other small towns. The phenomenon of top- heavy structure is non-existent within the Class II to VI size classes of towns. The small towns show a reverse pattern of spatial distribution. Here, the Class V towns have the highest share of population, and the share systematically declines with the higher order towns, Class II reporting the least (Table 2.5).

Chapter 3

Basic Infrastructure and Slums

In India, urban development is a state subject. The urban policies existing in the states are largely an extension of those outlined in Five Year Plans and other policies and programmes of the central government. The centre can, at the most, "issue directives, provide advisory services, set up model legislation and fund programmes which the states can follow at will" (Shaw 1996, cited in Batra 2009). The first two plan periods did not make any direct investment in urban development. The Third Five Year Plan (1961–1966) recognised the need for balanced regional development and advised that urban planning should adopt a regional approach. During this period, municipal administrations were entrusted to provide expansion of housing and improvement of living condition in the cities. Since the Fourth Five Year Plan (1969–1974) onwards, the government started withdrawing itself from certain directly funded activities like housing. During this period, Housing and Urban Development Corporation (HUDCO) was set up in 1970, which provided loans to new state capitals like Chandigarh, Bhubaneswar, Gandhinagar and Bhopal. It advocated the development of small and medium growth centres through lower interest rates for housing, water supply and sanitation – with an aim to redirect growth towards small towns and cities, with financial allocations from IDSMT (Integrated Development of Small and Medium Towns) scheme (Mahadevia 2003). The major hurdle noticed during this period was inadequate service and housing facilities in cities due to the growth of urban populations, especially migrants.¹

During the Fifth Plan (1974-1978), the main thrust was directed towards ameliorating the conditions of the backward sections of society. This was sought to be achieved by augmenting the programmes for the construction of housing colonies by State Housing Boards. While the bulk of this programme was being undertaken in the State Plans, the activities of HUDCO in the central sector were geared up to meet the expanding demand. The Sixth Plan (1980-1985) viewed the problems of shelter and urban development which were connected with the provision of safe water supply and adequate sanitation. In the Seventh Five Year Plan (1985–1990) the National Housing Policy (1988) was introduced. This project aimed at improving housing conditions and providing a minimum level of basic services to all. The Seventh Plan launched Urban Basic Services (UBS) especially for women and children of lower income families. The UBS was merged with Environmental Improvement of Urban Slums (EIUS) in 1990 and the name was changed to Urban Basic Services to the Poor (UBSP). The Nehru Rojgar Yojana was launched in 1989, with one of its key components being shelter upgradation.

¹ (<http://planningcommission.nic.in/plans/planrel/fiveyr/4th/4planch19.html>)

During the Eighth Five Year Plan (1992–1997), emphasis was given to small and medium towns which often acted as a linkage of large cities with the rural hinterland. Thus, emphasis was given in terms of employment generation in small and medium towns so that migrants could be directed from rural hinterlands towards these urban centres rather than to large cities. Moreover, emphasis was given to provide infrastructural facilities to these urban centres to support such growth. The coverage of such schemes involved towns/cities with a population ranging from 20,000 to 3,00,000.

Infrastructure problems were not the central focus of policy when the reforms began in mid-1991. The agenda for reforms in the early years was understandably dominated by crisis management and the need for domestic and external stabilisation. The primary focus therefore was on reducing the fiscal deficit to restore macro-economic stability and introducing a package of efficiency-oriented reforms aimed at deregulating the domestic economy, reforming trade and exchange rate policies and liberalising foreign investment policy. Besides, infrastructure was not a significant constraint on short-term economic performance at the start of the reform programme because there was considerable scope for expanding supplies of infrastructure services in the short run through better utilisation of existing capacity.

About 17.4 per cent of the urban population in India lives in slums where housing conditions are inhuman. Around 2.9 per cent of the urban houses are in dilapidated condition (Census 2011). The urban housing shortage in the country is around 18.78 million as per the estimate of the Technical Group on Urban Housing Shortage (TG-12) (2012–17). Of this, 0.53 million households are homeless and mainly dominated by single male migrants to the cities. 5.49 million per cent of urban households in India do not have access to safe drinking water,² 19 per cent of the households either have no latrine within their premises or defecate in the open, and 13 per cent households have no bathing facilities within the home (Census 2011). However, access to basic amenities is not even across states and urban centres – economically developed states and metropolitan cities have better infrastructural facilities as compared to less developed states and non-metropolitan cities. Disparities in access to basic amenities are also noted by caste and class affiliation of urban dwellers and across migrant and non-migrant households. Current evidence at the national level suggests a declining migration trend for rural people, who find it increasingly difficult to gain a foothold in cities. The process of urbanisation under the process of globalisation makes the cities less affordable for the poor in terms of living and access to basic amenities. Furthermore, the processes of slum clearance, beautification of cities and development of infrastructural facilities under ongoing urban missions have marginalised the poor, especially the migrants (Kundu 2011; Mahadevia 2011).

Although, government and parastatal agencies have been striving to meet the housing and infrastructure deficiency in urban areas, the coverage is far from satisfactory. Often service delivery was aimed towards large urban centres. Financial institutions like HUDCO, which plays a major role by lending loans for development of infrastructure, land acquisitions, housing loans and also in implementing social programmes of the government, are mainly concentrated in large cities. The small towns are generally not in a position to obtain the state government's guarantee due to its weak economic base and uncertain financial condition. Moreover, HUDCO loans are available to parastatal agencies and municipal corporations and bigger ULBs in the states. Such a condition also prevails in the case of cities in less developed states and in small and medium towns (Kundu, Bagchi and Kundu 1999). The Jawaharlal Nehru Urban Renewal Mission (JNNURM),

² Water from unsafe sources includes uncovered wells, springs, rivers/canals, tanks/ponds/lakes.

launched to provide basic services and infrastructure facilities also had a big city bias. The share of government funds allocated under JNNURM is largely biased against the non-mission cities/towns. The share of Urban Infrastructure Development Scheme for Small and Medium Towns (UIDSSMT) and Integrated Housing and Slum Development Programme (IHSDP) was 12.8 and 8.9 per cent respectively. The remaining share of 80 per cent funds is directed towards the 65 mission cities. The big city bias of JNNURM is also reflected in the per capita spending by the central government between 2005 and 2009; the figure for mission cities works out to be Rs. 220 per capita per annum as compared to Rs. 119 for the non-mission cities (Kundu and Samanta 2011).

Of late, several urban schemes were launched by the government to improve the housing and basic services in cities. 'Housing for All by 2022', the Smart Cities Mission, and Atal Mission for Rejuvenation and Urban Transformation (AMRUT) are the most prominent ones aimed at upgrading the quality of life in Indian cities. However, along with central sponsorship, these missions also attract a large share of funds from private sources to sponsor these projects.

Despite the efforts made by the government there exists a huge gap between demand and supply. This chapter tries to analyse the level of services in various size classes of towns to understand the inequities and direct relationship between the size of town and level of services. The second section of the chapter deals with the level of services in slums existing in towns.

During the last decade, India has made progress in toilet facilities within premises, drainage, electricity and access to bathroom facilities. The progress in supply of drinking water through taps registered a marginal increase from 68.7 per cent in 2001 to 70.6 per cent in 2011 (Table 3.1).

While 70.6 per cent of the households in urban India have access to tap water, only 30.8 per cent of the households in rural India and 43.5 per cent in India as a whole have access to tap water. In towns of India, 61.7 per cent of the households have access to tap water. Rural India heavily relies on ground water sources (handpump 43.6%, well 13.3%, and tubewell 8.3%), while dependence on tap water is high in urban India, including towns (Table 3.2). Three-fourths of the total households in India have access to safe drinking water.³

Table 3.1: Access to Basic Amenities in Urban India: 2011 and 2001

India	2011	2001
Households using tap water as main source of drinking water	70.6	68.7
Households with toilet facility within premises (water closet)	72.6	46.1
Households with waste water collection into closed drains	44.5	34.5
Households with electricity as main source	92.7	87.6
Households with attached bathroom	77.5	70.4

Source : Calculations based on Census of India data, 2011 and 2001: Houses, Household Amenities and Assets

Table 3.2 : Percentage Distribution of Households by Main Source of Drinking Water, India, Rural, Urban and Towns: 2011

	Main Source of Drinking Water					Safe Drinking Water
	Tap water	Well	Hand pump	Tube well	Others	
India	43.5	11.0	33.5	8.5	3.4	75.5
Urban	70.6	6.2	11.9	8.9	2.5	84.4
Rural	30.8	13.3	43.6	8.3	3.9	71.3
All Towns	61.7	7.1	19.5	8.9	2.8	78.4

Source: Calculations based on Census of India data, 2011: Houses, Household Amenities and Assets

³ World Health Organisation: Access to safe drinking water is the proportion of people using improved drinking water sources such as household connection, public standpipe, borehole, protected well, protected spring, treated rainwater.

Table 3.3: Percentage Distribution of Households according to Distance of Main Source of Drinking Water: India, Rural, Urban and Towns, 2011
(per cent of households)

	Within Premises	Near Premises	Away
All India	46.6	35.8	17.6
Rural India	35.0	42.9	22.1
Urban India	71.2	20.7	8.0
All Towns	59.7	28.6	11.8

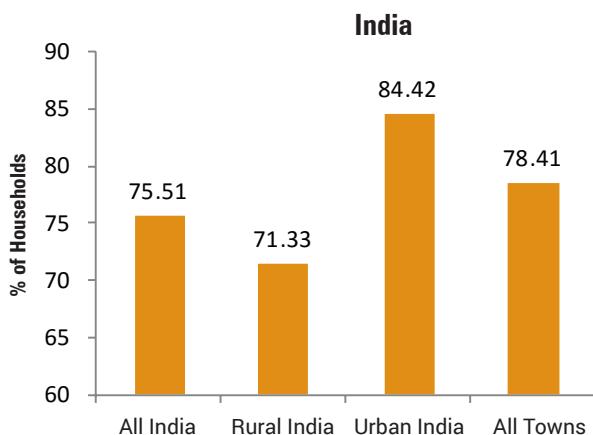

Note: within premises - if the source is located within the premises; near premises- is the source if located within the range of 100 m from premises in urban areas and 500 m in rural areas; away - if the source is beyond 100 m from premises in urban areas and 500 m in rural areas.

Source: Calculations based on Census of India data, 2011: Houses, Household Amenities and Assets

This proportion is higher in urban areas (84.4%) as compared to rural India (71.3%) and India as a whole (75.5%) (Chart 3.1). Moreover, not all the households have access to water supply within their premises. Only 46.6 per cent of the total households in India have access to drinking water within premises. This proportion is 71.2 per cent in urban areas, which is double than that in rural areas (35%) (Table 3.3).

Table 3.4 brings out the strong relationship between the size of towns and availability of water from taps. The access to tap water is higher in larger towns as compared to smaller towns. The dependence on ground water increases in small order towns (Table 3.4). The highest proportion of households having

Chart 3.2: Percentage Distribution of Households by Main Source of Drinking Water in Towns of India, 2011

Source: Calculations based on Census of India data, 2011: Houses, Household Amenities and Assets

access to safe drinking water is in Class II towns (82.0 %) and lowest in Class IV towns (74.4%). Not all households have access to some source of water within their premises. Only 65.7 per cent of the households in Class II have access to water within premises followed by 62.1 in Class III. Only one half of the total households in Class IV, Class V and Class VI have access to drinking water within premises (Table 3.5).

Only 15 towns⁴ have 100 per cent coverage of households through tap water. Among these, except for Ordnance Factory Muradnagar (UP), all the other 14 towns fall in Class VI category and are mainly industrial townships. As mentioned earlier, the Class VI towns are mostly industrial townships which show dynamism akin to Class I towns. The households covered through tap water are more than 90 per cent in nearly one-fifth of the total towns, while two-fifths of the towns have less than 50 per cent coverage through tap water. There are 6 towns where tap water is not available and households are completely dependent on ground water. These are Alipukur, Kanaipur, Bamna, Mahishrekha in West Bengal, Rangapahar in Odhisha and Indipur in Nagaland. All these towns are census towns in Class VI category.

There is a marked difference among urban and rural India in terms of the access to toilet facilities. While 87.4 per cent of the households in urban areas have access to toilets, only 32.7 per cent in rural India and 46.9 per cent in India as a whole have access to toilets. The percentage of households with access to flush/pour flush (within premises) is remarkably low in rural India (19.4%) and India as a whole (36.4%). In urban India and towns 72.6 and 57.4 per cent of the households have access to flush/pour flush toilets within premises respectively. Only 32.7 per cent of the households in urban India and 2.2 per cent in rural India are connected to pour flush toilets with a piped sewer. The value of the indicator for India as a whole also stands at an alarmingly low level at 11.9 per cent (Table 3.6 and Chart 3.3).

⁴ Gulmarg (MC) in Jammu and Kashmir, Palampur (M CI), Seoni (NP), Bakloh (CB), Naina Devi (M CI) and Dagshai (CB) in Himachal Pradesh, Kedarnath (NP) in Uttarakhand, Hawa (NT) in Arunachal Pradesh, Saputara (NA), Valia - Jhagadia (GNFC Scooter Project Area) (INA), GSFC (Motikhavdi Sikka) (INA), Por-Ramangamdi (INA), Vasna Borsad (INA), Valia (Naldhari) (INA) in Gujarat, Ordnance Factory Muradnagar (CT) in Uttar Pradesh

Chart 3.4 : Distribution of Households having Access to Flush/pour Flush Toilet within Premises: 2011

Source: Calculations based on Census of India data, 2011: Houses, Household Amenities and Assets

There is not much variation in terms of access of households to toilets at the size class levels. In Class II towns, 82.1 per cent of the households have access to toilets. This proportion of households decreases further with only 65.7 per cent of the households having access to toilets in Class V towns. In terms of the access to flush/pour flush latrine facility, only 66.8 per cent of the households in Class II towns, 58.4 in Class III, 50.8 in Class IV and 45.3 per cent in Class V towns are connected. Overall, the towns are largely dependent on septic tanks (43.91%) and the proportion of households connected with a piped sewer is only 11.17 per cent (Table 3.7 and Chart 3.4).

As per Census of India 2011, there are 201 towns where more than 75 per cent of the households practise open defecation, and 32 towns in Class IV and V where more than 90 per cent of the households defecate in open. In Hajan (MC) and Dara Pora (CT) in Jammu and Kashmir 71.7 per cent and 74.0 per cent of households use human scavenging for removal of night soil. Though the Prohibition of Employment as Manual Scavengers and their Rehabilitation Act, 2013 prohibits human scavenging, there are altogether 863 towns in India which still use human scavenging.

A detailed analysis of towns reveals that there are only 19 towns in India where all the households have access to toilets within their premises. These are Vapi (INA) in Gujarat in Class III category; Reliance Complex (INA) in Gujarat, Class V; B.R.P.L. Township (CT) Changtongya (TC) and Puranabazar 'A' (CT) in Nagaland, Paltapara (CT) in West Bengal in Class IV category; H.P.C. Township (CT), Laharjan Natun Bosti (CT) and Numaligarh Refinery Township (CT) in Assam, Valsad (INA), Valia - Jhagadia (GNFC Scooter Project Area) (INA), GSFC (Motikhavdi Sikka) (INA), Vaghodia (INA) and Valia (Naldhari) (INA) in Gujarat, Khonmoh (CT) and Gulmarg (MC) in Jammu and Kashmir, Biate (NT) in Mizoram, Highways (TP) in Tamil Nadu in Class VI category.

There are only 29 towns in India which can be termed as ODF (open defecation free) towns. However, these towns are spread across the country in different size classes and do not show any locational pattern. These towns are Vapi (INA) in Gujarat in Class III category; Reliance Complex (INA) in Gujarat, Amritsar Cantt (CB) in Punjab, Class V; B.R.P.L. Township (CT) and Niz Katigorah Pt III (CT) in Assam, Jalgaon (CT) in Maharashtra, Thenzawl (NT) in Mizoram, Changtongya (TC) and Puranabazar 'A' (CT) in Nagaland, Indian Telephone Industry, Mankapur (Special Gram) (CT) in U.P., Paltapara (CT) in West Bengal in Class IV category; H.P.C. Township (CT), Laharjan Natun Bosti (CT) and Numaligarh Refinery Township (CT) in Assam, Valsad (INA),

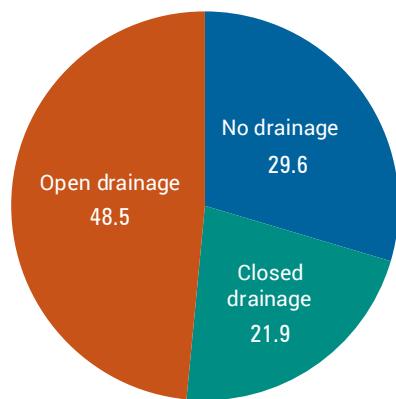

Table 3.8 : Percentage Distribution of Households with Drainage Facilities: 2011

(per cent of households)

Class	Drainage	No drainage	Waste water outlet connected to	
			Closed drainage	Open drainage
All India	51.14	48.86	18.13	33.01
Rural India	36.75	63.25	5.75	31.01
Urban India	81.77	18.23	44.50	37.26

Class III	73.34	26.66	21.61	51.74
Class IV	64.00	36.00	18.98	45.02
Class V	54.23	45.77	16.34	37.88
Class VI	54.49	45.51	17.46	37.03

Source: Calculations based on Census of India data, 2011: Houses, Household Amenities and Assets

Chart 3.5 : Percentage Distribution of Households with type of Drainage in Towns of India: 2011

Source: Calculations based on Census of India data, 2011: Houses, Household Amenities and Assets

Valia - Jhagadia (GNFC Scooter Project Area) (INA), GSFC (Motikhavdi Sikka) (INA), Vaghodia (INA) and Valia (Naldhari) (INA) in Gujarat, Naina Devi (M Cl) in Himachal Pradesh, Khonmoh (CT) and Gulmarg (MC) in Jammu and Kashmir, Karle (CT), Zotirpada (CT) and Mouje Anjanvel (CT) in Maharashtra, Khawhai (NT) and Biate (NT) in Mizoram, Highways (TP) in Tamil Nadu, Kedarnath (NP) in Uttrakhand in Class VI category.

In terms of the households' access to a waste water outlet connected to drainage, the same pattern is observed, with 81.77 per cent of the households in urban India having such access, as against 36.75 per cent of the households in rural India and 51.1 per cent in India as a whole (Table 3.8).

In towns of India, 70.3 per cent of the households have a drainage system of which only 21.9 per cent are connected to closed drainage (Chart 3.5). At the size class levels, 79.3 per cent of the households in Class II have access to drainage facilities. The proportion reduces to 73.3 per cent in Class III, 64 per cent in Class IV, 54 per cent in Class V and VI categories (Table 3.8). The waste water outlet is largely connected to open drainage in all the size classes of towns. An in-depth analysis shows that only in 24 towns⁵ out of 5,705, all households are covered with drainage facilities, while the coverage is found to be less than 50 per cent in 1,666 towns. A drainage system is completely non-existent in 7 towns of India, namely, Kathanian (CT) in Punjab of Class IV category, Forest Vill. Lakhipathar (CT) in Assam and Purba Ranaghat (CT) in West Bengal of Class V category, Vasna Borsad (INA) and Valia (Naldhari) (INA) in Gujarat in Class VI category.

The Census of India 2011 indicates that close to 31.4 per cent of India's total households continues to depend on kerosene for lighting, while even today 0.4 per cent of the households do not have access to lighting at all. This proportion is higher in rural India where nearly 43.2 per cent of households continue to depend on

⁵Vapi (INA) in Gujarat of Class III; Reliance Complex (INA) in Gujarat, Kondumal (CT) in Maharashtra, Bahadarabad (CT) in Uttarakhand of Class IV category; Indian Telephone Industry, Mankapur (Special Gram) (CT) in U.P. of Class V category; H.P.C. Township (CT) and Numaligarh Refinery Township (CT) in Assam, Valsad (INA), Valia - Jhagadia (GNFC Scooter Project Area) (INA), GSFC (Motikhavdi Sikka) (INA) and Por-Ramangamdi (INA) in Gujarat, Faizabad (CT) in Haryana, Sabathu (CB), Naina Devi (M Cl) and Dagshai (CB) in Himachal Pradesh, Gulmarg (MC) in Jammu and Kashmir, Aralgoria (CT) in Jharkhand, Zotirpada (CT) in Maharashtra, T.T.P.S. Township (CT) and O.C.L. (ITS) in Odisha, Pavi Sadakpur (CT) in U.P., Badrinathpuri (NP) and Kedarnath (NP) in Uttarakhand, Santaldih Thermal Power Project-Town (CT) in West Bengal of Class VI category.

Table 3.9: Percentage Distribution of Households by Main Source of Lighting: 2011

(per cent of households)

	Main Source of Lighting				
	Electricity	Kerosene	Solar energy	Oil or any other	No lighting
All India	67.25	31.43	0.44	0.40	0.47
Rural India	55.31	43.15	0.55	0.46	0.54

Source: Calculations based on Census of India data, 2011: Houses, Household Amenities and Assets

kerosene for lighting and 0.5 per cent of households (close to 897,760) do not have access to lighting at all (Table 3.9). In the urban areas, 92.7 per cent of the households use electricity as the main source of lighting. In towns of India, this proportion is a little lower (85.9%) but is still higher than rural India and India as a whole. The use of alternative energy such as solar is higher in rural areas (0.5%) than in urban areas (0.2%).

An attempt has been made in this section to develop an infrastructure performance index for the towns of India. This infrastructure index is able to explain the inter-town variation in the access to basic infrastructure facilities, holding other factors constant. It helps to understand how well or how badly the town's basic infrastructure has been functioning compared to others.

There are many aspects of basic infrastructure which complement each other. While these indicators are correlated among themselves, none of them captures the overall availability of infrastructure adequately. For example, a town may have a very good network of piped water supply but covered drainage may not be good. A Principal Component Analysis (PCA) has been used in constructing a unique single index that captures the variance or information contained in different variables capturing different aspects of infrastructure. PCA finds linear combinations of the original variables to construct the principal components or factors with a variance greater than any single original variable.

To arrive at such an index, the principal component analysis (PCA)⁶ has been worked out based on four parameters: (i) access to tap water from a treated source within the premises; (ii) flush latrine facility with piped sewer within the premises; (iii) bathroom within the premises; and (iv) waste water outlet connected to closed drainage.

⁶ Principal component analysis (PCA) is a mathematical procedure that uses orthogonal transformation to convert a set of observations of possibly correlated variables into a set of values of linearly uncorrelated variables called principal components. PCA is the simplest of the true eigenvector-based multivariate analyses. Often, its operation can be thought of as revealing the internal structure of the data in a way that best explains the variance in the data. It is a commonly used method of factor analysis, used to develop indices from a set of possibly correlated variables. It is supposed to be one of the better ways of indexation, because this method derives its weightages from the sets of data; instead of the researcher extraneously supplying with the set of weightage based on understanding of the data sets and assumptions.

Table 3.10: Inequality in the Access to Basic Infrastructure across Towns and Cities: 2011

Coefficient of Variation	Households with Treated Tap Water within premises	Households with Toilets connected to piped sewer within premises	Households with Bathroom within premises	Households with Waste Water Outlet connected to closed drainage
Metro Cities	32.66	54.15	11.00	36.82
Non-Metropolitan Class I Cities	50.86	100.82	18.59	60.62
Towns	69.69	157.94	31.13	97.38

Source: Calculations based on Census of India data, 2011

An analysis of the aggregate basic infrastructure index values for 2011 (using PCA) shows Reliance Complex (INA), and GSFC (Motikhavdi Sikka) (INA), both in Gujarat as the best towns in India, and Lalpur (CT), in West Bengal as the worst. Table 3.11 gives a representation of the five best and five worst towns in each of the size class towns in terms of the basic infrastructure index.

Table 3.10 brings out the fact that inequality in the access to services is the highest for towns followed by Class I non-metropolitan cities and metropolitan cities. This is true for all services. The inequality in towns is the highest for latrine facilities. Table 3.10 reveals that inequity between metropolitan cities and towns is nearly three times in terms of access to toilet, bathroom and drainage facilities, while it is double in households with access to tap water within premises. Also, Table 3.11 identifies the best and the worst towns in each size class. While the good performing towns are spread across different states, the worst performing towns are concentrated in the state of West Bengal. This is true for all size classes. It may also be noted that these towns are census towns, which are still rural in character and administration. These points to the fact that rural West Bengal lags behind in infrastructural facilities and needs substantial investment in improving the condition of basic services.

State of Slums in Towns

A large part of the increase in urban population occurred in slums due to the natural growth factor and inability of the poor to access formal housing. As per Census 2011, the slum households in the country are 13.7 million accounting for 17.4 per cent of the total households. In terms of population, 60.3 million people live in slums in 2,543⁷ cities and towns which constitute 16.0 per cent of the total urban population. The 2011 data is difficult to compare with previous years, because the 2011 Census covers all 4,041 statutory towns in India, as compared to 2001 when only statutory towns

A slum, for the Census, has been defined as a residential area where dwellings are unfit for human habitation because of dilapidation, over-crowding, faulty arrangements and design of such buildings, narrowness or faulty arrangement of street, lack of ventilation, light, or sanitation facilities or any combination of these factors which are detrimental to safety and health. According to the Census of 2011, the definition of slum was broadened and three types of slums were defined, namely:

- All notified areas in a town or city described as 'slum' by state, union territory administration or local government under any act including a 'Slum Act' may be considered as notified slums;
- All areas recognised as 'slum' by state, union territory administration or local government, housing and slum boards, which have not been formally notified as slums under any act may be considered as recognized slums; and
- A compact area with a population of at least 300 or approximately 60-70 households of poorly built congested tenements in unhygienic environments, usually with inadequate infrastructure and lacking in proper sanitary and drinking water facilities. Such areas should be identified personally by the charge officer and also inspected by an officer nominated by the directorate of Census operations. This fact must be duly recorded in the charge register. Such areas may be considered as identified slums.

⁷There were 2,613 slums reported cities and towns in India. The datasets on Housing stock, Amenities and Assets based on the Houselisting and Housing Census for slums has been released for only 2,543 cities and towns.

Table 3.12: Distribution of Slum Households and Population Across Various Size Class Categories: 2011

Size of Class	Slum Population Distribution (%)	Average Household Size in slums

All Towns	64.4	1.1	18.9	8.4	7.3	92.7	44.3	39.5	16.2

Note: within premises - if the source is located within the premises; near premises- is the source is located within the range of 100 m from premises; away - if the source is beyond 100 m from premises in urban areas.

Source: Calculations based on Census of India data, 2011: Houses, Household Amenities and Assets in Slums

with a population over 20,000⁸ were covered. The 2001 data had set India's slum population at 18.3 per cent of the total population.

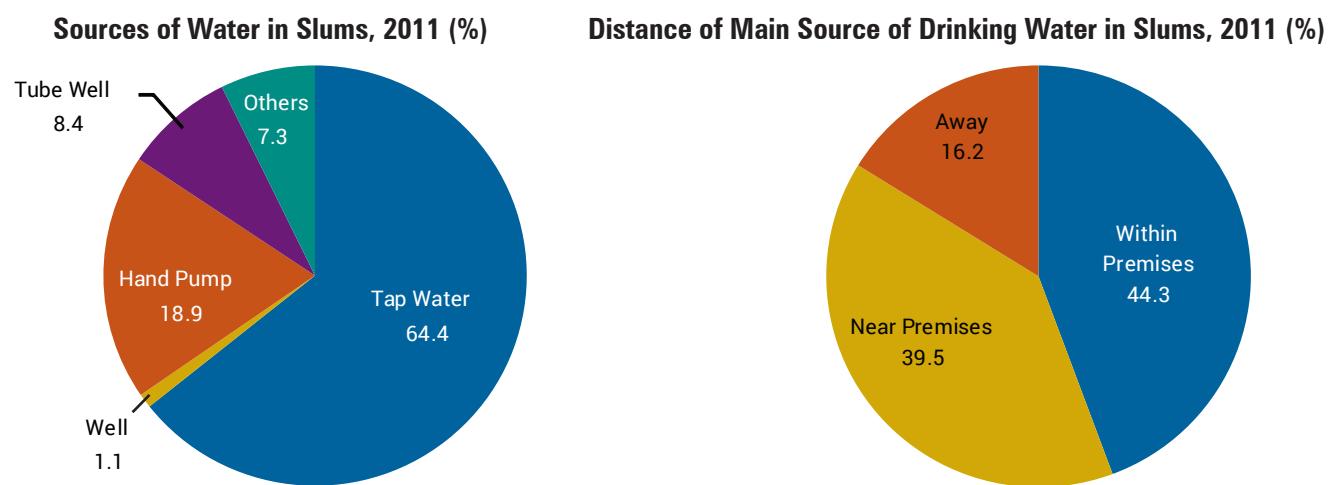

Out of the total 5,705 towns in India, slums were reported in only 1,893 statutory UA/towns. The slum population is largely concentrated in Class I cities (73.5%). The share of slum population residing in towns is only 26 per cent. Among the size class categories of towns, the highest concentration of slum population is in Class II towns (11.8%) and Class III (10.4%) categories (Table 3.12).

⁸ In Census 2001, information on slums was released only on demographic characteristics based on the Population Enumeration. For this purpose, Slum Blocks were identified in statutory towns having a population of 20,000 by the local authorities during the Population Enumeration phase.

A size class analysis of slums brings out interesting features. The entire population is declared as slums in 7 towns. These are Safipur (NP), Ugu (NP), and Nyotini (NP) in Uttar Pradesh, Hajan (MC), Magam (MC) and Beerwah (MC) in Jammu and Kashmir, and Nayabazar Notified Bazar Area in Sikkim. Valparai in Tamil Nadu and Hojai in Assam have the lowest share of slum population among all the size classes of towns. The share of slum population is more than 50 per cent in 252 in towns while 454 towns reported a slum population of less than 10 per cent. Table 3.13 presents the highest and lowest share of slum populations in each of the size class categories.

Table 3.14 reveals that most of the slum households have access to safe drinking water in urban India and towns as well. In urban India, 74.0 per cent of slum households have access to tap water. The value for the same indicator in towns is 64.4 per cent. The handpump is the second largest source of drinking water in slums both in urban India and towns. As many as 18.9 per cent of the slum households in towns use a handpump as the main source of drinking water. In terms of access to water within premises, only 56.7 per

All Towns	7.7	35.2	2.2	45.0	8.5	1.8	7.6	37.0

Source: Calculations based on Census of India data, 2011: Houses, Household Amenities and Assets in Slums

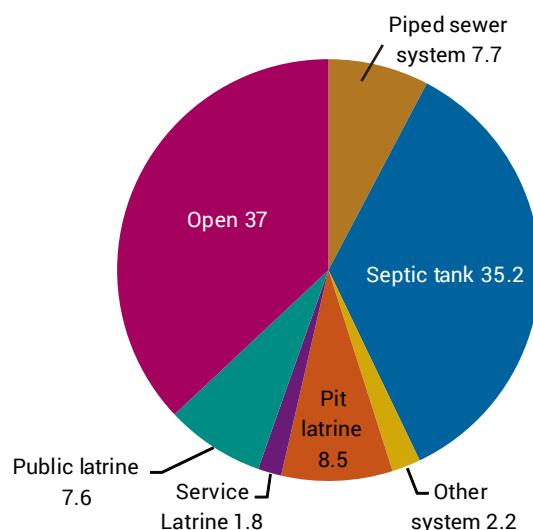

cent of the total slum households in urban India and 44.3 per cent in towns have access to drinking water within premises. The source is near the premises in 39.4 per cent of the households while it is away from premises in 16.2 per cent of the slum households in towns. There are 22 towns where piped water supply is non-existent in slums and households are completely dependent on underground water. In 81 towns all the slums households have access to piped water supply.

Nearly one-half of the total slum households in towns do not have access to toilet facilities within premises. Among those who do not have toilet facilities within premises, only 7.6 per cent of the households use public toilets while 37.0 per cent practise open defecation. In 118 towns reporting slums, more than 90 per cent of the slum households practise open defecation, while in 1,010 towns reporting slums, more than 50 per cent of the households practise open defecation. In terms of the access to pour flush latrine facility with piped sewer, only 7.7 per cent of the slum households in towns are connected to a sewer system. The value of the indicator for slum households in urban India stands at 24.5 per cent (Table 3.15).

Access to toilet within the size class level decreases in the lower order towns. In Class II towns 62.4 per cent of the slum households have access to toilets while this proportion decreases, with only 32.5 per cent households having access to toilets in the Class V category. Seen in terms of the access to a pour flush latrine facility with piped sewer, only 9.5 per cent of the slum households in Class II towns are connected to a sewer system. The value further decreases in the lower order towns.

In terms of waste water outlets connected to drainage, 81.2 per cent of the slum households in urban India and 67.1 per cent in towns of India have access to either open or closed drainage. Among those who have access to drainage, only 22.0. per cent of the households are connected to covered drains in towns as compared to 45.5 per cent in urban India (Table 3.16). In 133 towns reporting slums more than 90 per cent of the slum households do not have access to any type of drainage while a drainage system is completely non-existent in slums in 28 towns

The Census of India 2011 indicates that nearly 80 per cent of slum households use electricity as the main source of lighting in urban India as well as in towns of India. Only close to 0.8 per cent of urban India's total slum households as well as households in towns do not have any access to lighting. The dependence on other sources such as kerosene, solar, or other oil is higher in lower order towns. As many as 23.2 per cent of the slum households in Class VI are dependent on other sources, while this proportion is as low as 9.8 per cent in Class II towns (Table 3.17). In 986 towns reporting slums, more than 90 per cent of the households use electricity as a main source of lighting, whereas in 20 towns more than 90 per cent of the households are dependent on other sources (kerosene).

Table 3.17: Distribution of Slums Households by Main Source of Lighting: 2011

	Electricity	Other Sources	No lighting
Urban India	80.5	18.7	0.8
Class I	92.8	6.6	0.6
Class II	89.6	9.8	0.6
Class III	86.0	13.3	0.7
Class IV	82.8	16.5	0.7

Class VI	75.8	23.2	1.0
All Towns	80.1	19.1	0.8

Source: Calculations based on Census of India data, 2011: Houses, Household Amenities and Assets in Slums

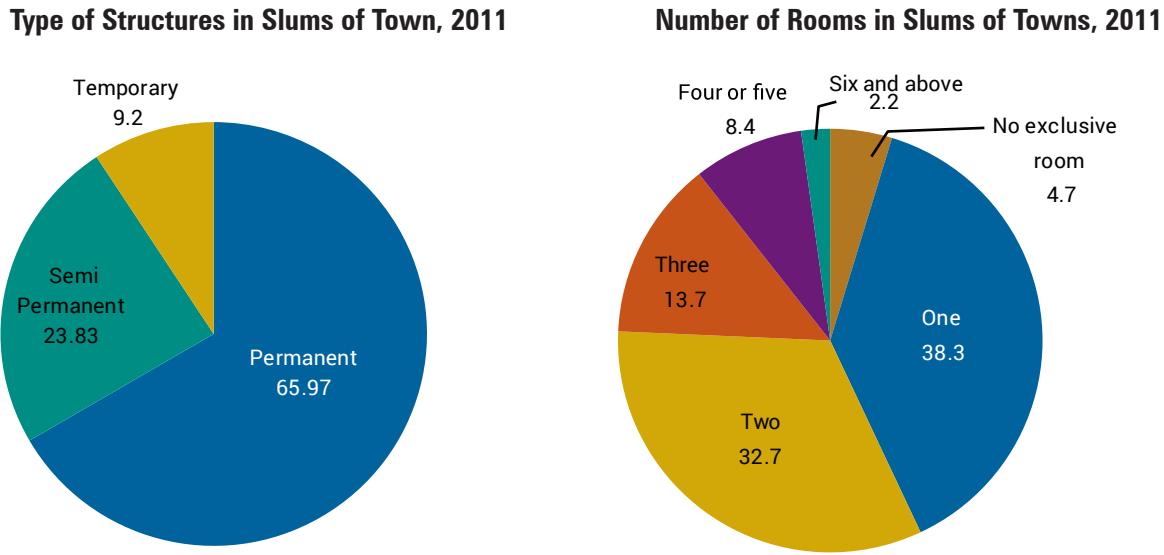

A large number of slums are situated at most vulnerable locations such as in the vicinity of drains, riverbanks, etc. These slums have a mixture of housing ranging from pucca, semi-pucca (where there is brick masonry with mud plaster) to kutcha mud houses and small shacks made of wood/bamboo slates and plastic sheets. Housing structures are single storeyed, one- to two-room houses averaging an area of 300–400 square feet. The quality of housing stock depends on a combination of factors such as the age of settlement, tenure security and infrastructure provisions. The impact of tenure security is largely reflected on the quality of structure. The Census of India 2011 has for the first time released datasets on Housing Stock and Amenities for slums in India.

Most of the slum houses in urban India have permanent structures as per the Census of India, 2011. Only 4.6 per cent have temporary structures and 14.8 per cent have semi-permanent structures. The same pattern is also observed in towns, where 65.9 per cent of the slum houses have a permanent structure, 23.8 per cent have semi-permanent structures and 9.2 per cent have temporary structures (Table 3.18). The quality of structure deteriorates in lower order towns. In Class IV and Class V towns nearly one-half of the total houses either have semi-permanent or temporary structures.

Table 3.18: Condition and Use of Housing Structures in Slums of Towns: 2011

Size Class	Type of Structures				Use of Structures	
	Permanent	Semi Permanent	Temporary	Unclassified	Residence	Residence-cum-other use

Source: Calculations based on Census of India data, 2011: Houses, Household Amenities and Assets in Slums

Most of the slum structures have either one or two rooms. Only 4.4 per cent houses in urban India and 4.7 per cent houses in towns do not have any exclusive room. As many as 71 per cent of the slum structures have two or three rooms for a household size of 4.7 in towns of India (Table 3.19). Most of the slum households use their structures for residential purposes only. In urban India and also in towns, only 3.0 per cent of the total houses are used for residential cum other use. Nearly one-third of the total slum structures have been rented out in urban India while the value for the same in towns is four-fifths. The share of own structures decreases in the higher order towns.

The analysis in this section reveals that urban basic services are not evenly distributed across Indian towns and cities. The coverage is higher in big cities and declines systematically with size class. Also, the slums,

in general, have lower access to services as compared to towns and cities. It is a fact that the JNNURM has provided for substantial central assistance to cities for infrastructure development, and has indeed been effective in renewing the country's focus on the urban sector. However, it has resulted in polarised development and an inbuilt big-city bias. The existing missions also focus on cities with populations above one lakh, thus leaving the towns behind. Many of the towns are transition points between the urban and the rural. The process of moving from rural to urban throws up some unique challenges that require more than standard solutions. Although towns have been transformed into 'urban' in their administrative identities, their social and physical infrastructure still remains at a rudimentary level.

Chapter 4

Social and Economic Condition

Economic development and social development are closely associated with each other. Indicators of social and economic aspects are important tools for evaluating levels of social and economic development and inclusive growth. UNDP's Human Development Index (HDI) is one measure that has tried to re-focus attention on the importance of non-monetary measures of human progress. There are countries where economic development does not necessarily take into account concomitant investment for improvement of the social sector, resulting in lopsided development. It is important for India to invest in the social sector to promote balanced development of the country. Keeping the above in view, the present chapter tries to analyse the social and economic indicators of the towns of India. An analysis has been done to bring out the gender gap as well. Indicators like sex ratio, literacy, household size, work participation ratio, share of workers in different sectors have been analysed at the size class level.

Sex Ratio and Child Sex Ratio

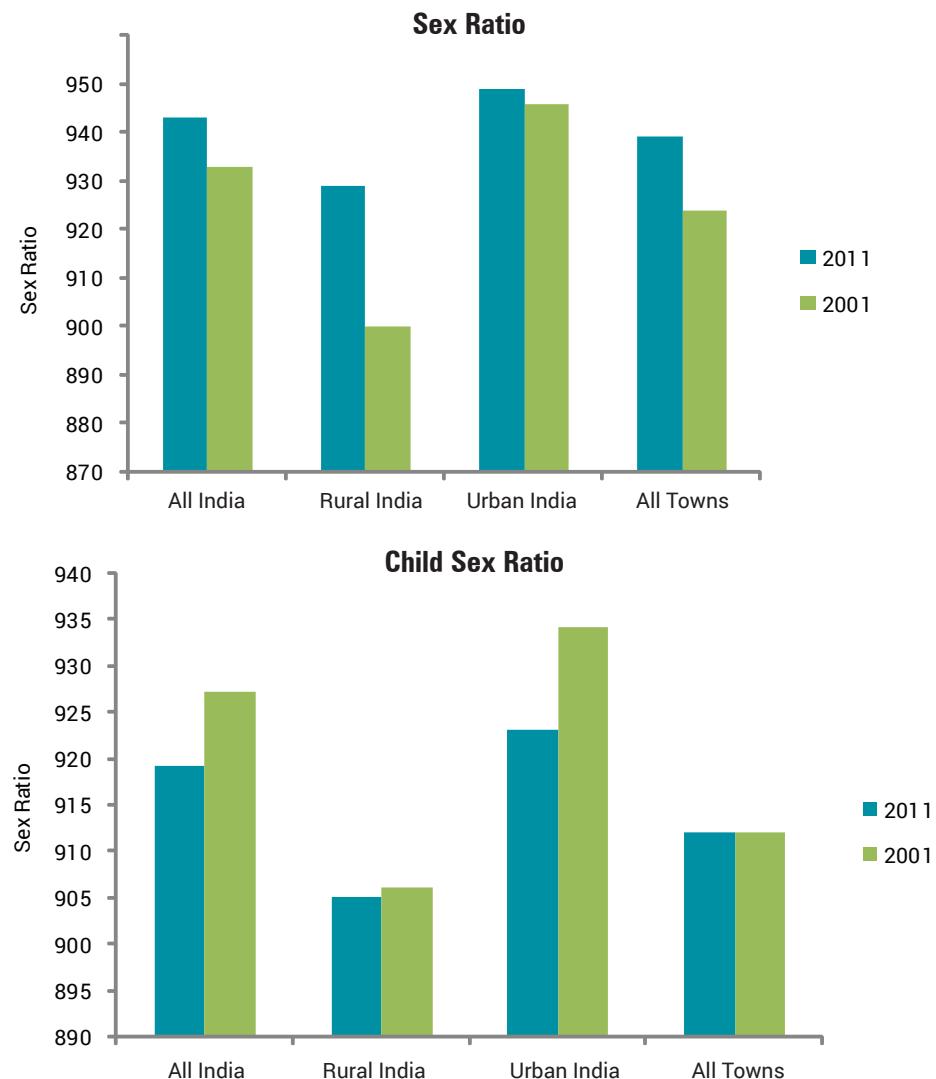

Sex ratio is defined as the number of females per 1,000 males. Sex composition is an important aspect of the demographic structure. It is a result of a number of factors working together over a period of time. Imbalance is caused either by differential birth rate or differential death rate. In addition to these, migration also causes a significant difference in sex composition in the working age group.

In 2011, the overall sex ratio for India was 943, 949 for rural India and 929 for urban India. While the sex ratio in rural India has not seen much improvement from 2001 to 2011, the ratio for urban India has witnessed an increase of 29 points (Table 4.1 and Chart 4.1)). However, the ratio is still below the national average by 14 points. The towns of India have an overall sex ratio of 939 which is lower than the national average but higher than urban India. The sex ratio in towns of India has increased by 15 points from 2001 to 2011.

Table 4.1: Sex Ratio in India, Rural, Urban and Towns: 2011 and 2001

Overall Sex Ratio	2011	2001	Difference
India	943	933	10
Urban India	929	900	29
Rural India	949	946	3
All Towns	939	924	15
Child Sex Ratio (0-6 years)	2011	2001	Difference
India	918	927	-9
Urban India	905	906	-1
Rural India	923	934	-11

Chart 4.1: Sex Ratio and Child Sex Ratio in India, Rural, Urban and Towns: 2011

Source: Calculations based on Census of India data, 2001 and 2011

Among the Class II to Class VI size classes of towns, the highest sex ratio of 942 is observed in Class II and Class V categories. Class VI has the lowest sex ratio of 924 in spite of the significant increase of 58 points from 2001 (Table 4.2). This may be due to the special status of these towns. These are mainly industrial townships where migration of males is high. The improvement has largely been observed in Classes V and VI, while Classes II, III and IV have registered a moderate improvement.

The number of females per 1,000 males in the age group of 0-6 years is low compared to the overall sex ratio across all the size classes of cities in India reflecting a bias towards the male child. Table 4.2 shows that not only is the sex ratio low but it also has shown a decline from 2001. The available literature in this context suggests that a combination of factors, namely, the urge to have a son, acceptance of the small family norm, access to pre-natal sex determination tests, and abortion have worsened the situation (Bose, 2002; Dasgupta, 2005; Goodkind, 1999; Ganatra, et al., 2001; Bhat, 2002; and Mallik, 2003).

The child sex ratio of India has decreased by 9 points from 927 in 2001 to 918 in 2011. Rural India has witnessed the highest decline of 11 points from 2001 to 2011, while the situation remained unchanged in towns of India and in urban India as a whole.

At the size class level of towns, Class III towns seem to be the only exception to have witnessed a fall in the number of girl children from 913 in 2001 to 909 in 2011. This fall could be attributed to one or more of the reasons mentioned earlier. In Class II and Class IV the population of the girl child has not witnessed any change during the decade 2001 to 2011. The ratio has improved in small order towns, that is, in Classes V and VI by 8 and 14 points respectively.

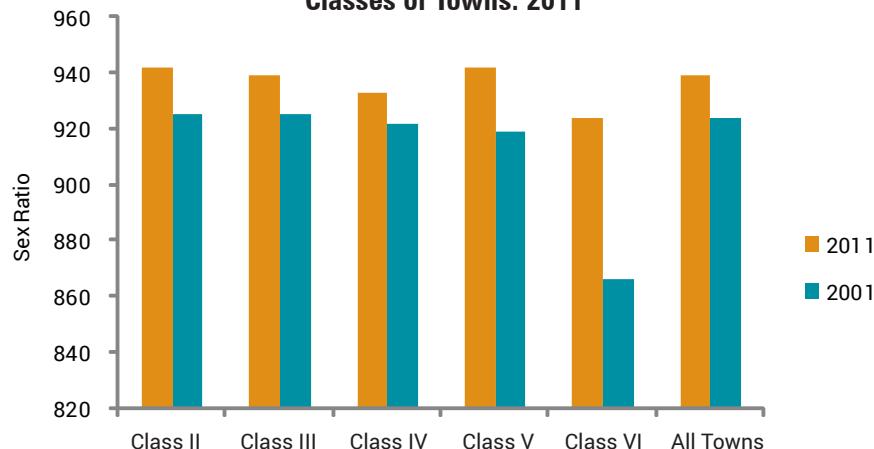

Among all the towns, there exists a wide variation in sex ratio. Gulmarg (MC) in Jammu and Kashmir has the lowest¹ sex ratio at 4, followed by Kedarnath (NP) in Uttarakhand where the sex ratio is 5. On the other hand, Banasthali (CT) in Rajasthan has the highest sex ratio of 3,878. The reason for such a high variation is the unique characteristic of the particular town. Banasthali town houses 'Banasthali Vidyapith', a centre of learning for girls from nursery to doctoral level. Gulmarg is a skiing destination while Kedarnath is a pilgrimage town, both located on the hills of the Himalayas and not easily accessible (Table 4.3). The towns with highest and lowest child sex ratios are both in the state of Gujarat. GSFC (Motikhavdi Sikka) has the lowest child sex ratio of 435 and Valia-Jhagadia (GNFC Scooter Project Area) (INA) has the highest child sex ratio at 1,583, indicating high disparity among towns of the same state (Table 4.4).

Table 4.2: Sex Ratio by Size Classes of Towns: 2011 and 2001

Overall Sex Ratio	2011	2001	Difference
Class II	942	925	17

Literacy

The definition of 'literacy' in the Population Census of India is fairly liberal.² In the Census enumeration, 'a person, who can read and write with understanding in any language, is seven years and above is treated as literate'. The person may or may not have received any formal education.

² If literacy is measured in terms of years of schooling, the average is merely 2.4 years in India for persons aged 25 and above (Dreze and Sen, 1995).

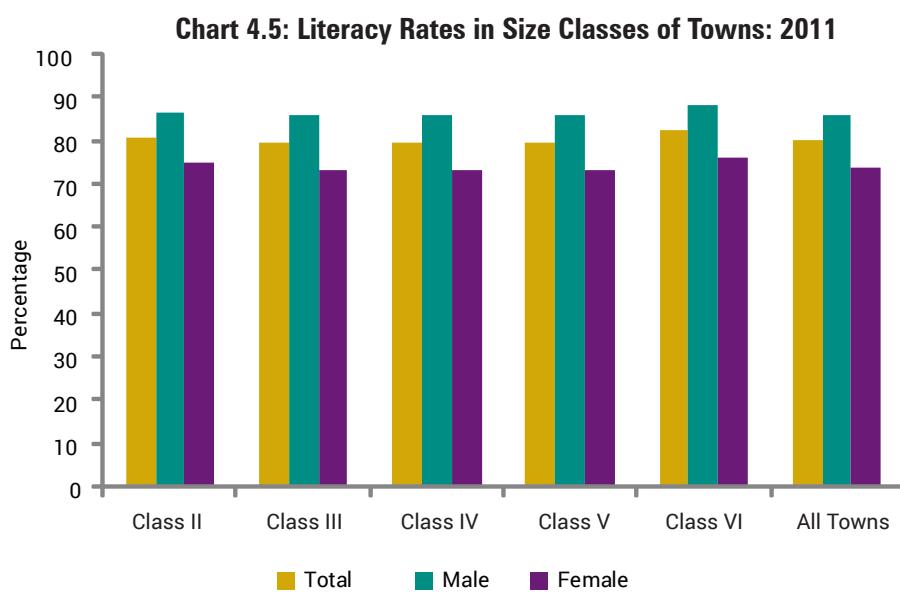

An analysis of literacy rates shows that in 2011, towns have a slightly lower literacy rate than urban India, 80.2 per cent against 84.1 per cent but higher than rural India and India as a whole. Literacy rates in towns of India have increased from 75.7 per cent in 2001 to 80.2 per cent in 2011, an increase of 4.5 per cent points. Both male and female literacy rates in towns of India have witnessed a similar trend. They are slightly lower than urban India but higher than rural India and India as a whole (Table 4.5). The male literacy rate in towns of India has increased from 83.7 per cent to 86.3 per cent while the female literacy rate has increased from 67.1 per cent to 73.7 per cent. The gender gap in towns of India is quite large at 12.6 per cent in 2011; it is much larger than the gender gap for urban India. However, the gender gap has reduced by 4.1 per cent points between from 2001 and 2011 in towns of India.

As per Census of India 2011 all size classes of towns have shown slow yet gradual increase in literacy rates between 2001 and 2011. The female literacy rate has increased at a higher rate as compared to the male literacy rate in all the size classes of towns. In 2011, among the various size classes of towns in India, the highest literacy rate is observed in Class VI towns (82.5%) followed by Class II towns (80.9%). The highest increase in literacy rate has been seen in Class V towns, where the literacy rates have increased from 74.4 per cent in 2001 to 79.9 per cent in 2011. An examination of gender-disaggregated data reveals a similar pattern. Class VI towns have the highest

male (88.6%) and female literacy rates (75.9%) followed by Class II towns. The gender gap is highest in Class IV and V towns (13.2%) though it has shown a decreasing trend in all the size classes of towns (Table 4.6).

Valia in Gujarat has the highest overall literacy rate (100%) followed by GSFC (Motikhavdi Sikka) (99.53%), while the town of Kumarpur in Jharkhand has the lowest rate at 29.21 per cent. The three towns, namely, Valia and GSFC (Motikhavdi Sikka) in Gujarat and Gangotri in Uttarakhand have 100 per cent male literacy rate. The highest female literacy rate is observed in GSFC (Motikhavdi Sikka) in Gujarat and Gulmarg in Jammu and Kashmir. The lowest literacy rate for both male and female were found in Kumarpur in Jharkhand (Table 4.7).

Household Size

The decade 2001-2011 witnessed a decline in the rate of population growth. Households multiplied at a greater pace during this decade, although the average size of the households registered a decline from 5.3 to 4.9 (Table 4.9). As per Census of India 2011, the average household size is declining in all classes of cities and towns in India, while at the same time, the number of households are increasing at a much faster rate than the rate of population growth (Table 4.8). Demographers attribute this change to a deepening of the demographic transition process in India associated with fertility decline. This is also indicative of a rise in nuclear families. The annual exponential growth rate of households was highest in urban India (3.7%).

There is not much difference in the average household size for rural, urban or India as a whole. The average household size in towns of India in 2011 was 4.79, while that for urban India it was 4.66 (Table 4.9). It was a little higher in rural India (4.94) and at the all-India level (4.85). Although all the size categories of settlements have shown a decline in household sizes in the recent decade (2001-2011), the largest decline was registered by towns (0.50) followed by urban India (0.46).

Among the various size class levels, there is not much difference in the average household size in 2011 (Table 4.10). Class V has the lowest household size (4.53), whereas Class III has the highest household size (4.92). All the size classes of towns have shown decline in the average household size. The 2011 Census also reveals that the rate of formation of households during 2001-2011 was higher in all the size classes of towns as compared to the population growth rate (Table 4.10). The growth rate of households systematically improves with smaller order towns. This trend is also evident in the population growth rate (Table 4.11).

Table 4.8: Annual Exponential Growth Rate of Households and Population in India, Rural, Urban and Towns: 2001-2011

Table 4.12: Highest and Lowest Household Size by Size Classes of Towns: 2011

Size Class	Highest	Lowest
Class II	Muhammadabad (UA), Uttar Pradesh (7.47)	Dadhel (CT), Daman and Diu (3.48)
Class III	Kupwara (MC), Jammu and Kashmir (11.26)	Vellakoil (M), Tamil Nadu (3.32)
Class IV	Trehgam (CT), Jammu and Kashmir (12.39)	Reliance Complex (INA), Gujarat (3.07)
Class V	Dara Pora (CT), Jammu and Kashmir (11.5)	Kilampadi (TP), Tamil Nadu (3.12)
Class VI	Khonmoh (CT), Jammu and Kashmir (12.33)	Kedarnath (NP), Uttarakhand (2.06)
All Towns	Trehgam (CT), Jammu and Kashmir (12.39)	Kedarnath (NP), Uttarakhand (2.06)

Source: Calculations based on Census of India data, 2011

Trehgam census town (Jammu & Kashmir) has the highest³ household size (12.4) and Kedarnath (NP) (Uttarakhand) has the lowest (2.1) among the 5,705 towns of India. Of the total 5,705 towns 2,276 have household sizes above the level of 5.00 (Table 4.12).

Social Index Values for the Towns of India

An attempt has been made in this section to develop a social performance index for the 5,705 towns in order to understand their overall social condition. To arrive at such an index, a principal component analysis (PCA) has been used based on five parameters:

- (i) sex ratio
- (ii) child (0-6 years) sex ratio
- (iii) male literacy rate
- (iv) female literacy rate
- (v) overall literacy rate

An analysis of aggregate social index values for the towns shows GSFC (Motikhavdi Sikka) (INA) Gujarat as the best town and Kumarpur (CT) Jharkhand as the worst. Table 4.14 gives a representation of the five best and five worst towns in each size class in terms of the social index.

Table 4.13 brings out the fact that inequality in the social indicators is highest for towns followed by Class I non-metropolitan cities and metropolitan cities. This is true for all social indicators. The inequality in towns is the highest for female literacy rate. Table 4.13 reveals that inequity between metropolitan cities and towns is nearly two times in terms in all the indicators.

³ Gulmarg (MC) in Jammu and Kashmir has the highest household size (25.5). It was not taken into consideration while calculating the average household size. There are only 8 females against 1,957 males.

Table 4.13: Inequality in Social Indicators: Towns and Cities, 2011

Coefficient of Variation	Sex Ratio	Child Sex Ratio	Literacy Rate Total	Literacy Rate Male	Literacy Rate Female
Metropolitan Cities	8.47	4.96	6.60	5.17	8.70
Class I Non-metropolitan Cities	6.15	5.07	7.97	6.54	10.24
Towns	9.99	8.14	11.71	9.29	15.54

Note: Valia (Naldheri) (INA) has been excluded from the total number of towns as sex ratio, child sex ratio and female literacy rate is 0.

Work Participation Rate

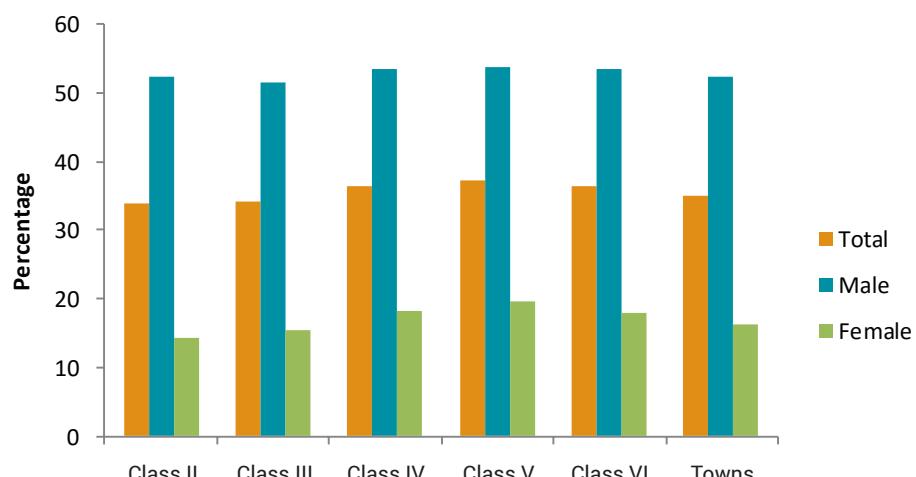

The average work participation rate (WPR) which is defined as the percentage of total workers to the total population has shown an increasing trend during the decade 2001-2011 except in rural India. As per Census of India 2011, the WPR in India has increased by 2.5 percentage points between 2001 and 2011, from 32.5 per cent to 35.0 per cent. The highest increase of 3.1 percentage points was observed in urban India (Table 4.15). Rural India has observed a declining trend by 0.2 percentage points due to decline in the female work participation rate. However, rural India reports the highest WPR (41.8%) as compared to urban India (35.3%) and India as a whole (39.8%), reflecting high engagement of household labour in agricultural pursuits in rural India. The towns report the lowest WPR (35.0%) (Chart 4.6).

Source: Calculations based on Census of India data, 2011

There is not much variation in the work participation rate within the various size classes of towns (Chart 4.7). During 2001-2011, the WPR has seen an increasing trend in all the size classes of towns, as well as in the case of both male and female participation rates. The highest increase was observed in Class II category where the WPR increased by 2.7 per cent points. Class VI witnessed the lowest increase of 0.9 per cent points (Table 4.16).

At a gender disaggregated level, the WPR for both males as well as females has seen an increase during 2001-2011 in towns of India. The female participation rate in 2011 is only 16.2 per cent whereas the male participation rate is 52.6 per cent in towns of India. This indicates that contrary to rural India, there is less engagement of females in economic activities in small towns.

Tattilli census town in Karnataka has the lowest WPR at 9.6 per cent followed by Akkalkuwa in Maharashtra (15.3%). Gulmarg in Jammu and Kashmir has the highest at 99.8 per cent followed by Kedarnath in Uttrakhand at 98.7% . The WPR for males is lowest at 6.5 per cent in the town of Tattilli and the highest at 99.94 per cent in Gulmarg. The WPR for females is the lowest at 1.65 per cent in the town of Colgong in Bihar, and is highest at 80.2 per cent in the town of Badrinathpuri in Uttarakhand (Table 4.17).

Classification of Workers

Table 4.18 shows dominance of employment in the agricultural and allied activities in rural India and India as a whole. There is, however, a decline in the proportion of workers in the agricultural sector by 4 per cent during the decade 2001-2011 in India. In the agriculture sector, a shift was noticed in the share of cultivators and agricultural labourers. The proportion of cultivators declined while the share of agricultural labourers increased from 2001 to 2011 suggesting immiseration of the rural economy. Many small cultivators could not keep their land parcels and started working as agricultural labourers. The share of household workers does not differ much across rural, urban and India as a whole. In urban India, the maximum share of workers is concentrated in other services and its share has remained constant over the decade.

Table 4.18: Classifications of Workers in India, Rural, Urban and Towns: 2001-2011

Classification		2011				2001			
		India	Rural	Urban	Towns	India	Rural	Urban	Towns
Cultivators	Total	24.6	33.0	2.8	6.2	31.7	40.1	3.2	6.7
	Male	24.9	35.2	2.7	6.2	31.3	42.2	3	6.4
	Female	24.0	28.8	3.1	6.1	32.5	36.5	4.3	8.1
Agriculture Laborers	Total	30	39.3	5.5	12.6	26.7	33.2	4.7	11.5
	Male	24.9	34.4	4.6	10.4	20.8	27.5	3.4	8.5
	Female	41.1	48.5	9.0	20.4	39.4	43.4	10.5	22.6
Household Workers	Total	3.8	3.4	4.8	6.2	4.1	3.8	5.1	6.9
	Male	2.9	2.6	3.7	4.5	3.0	2.8	3.5	4.6
	Female	5.7	5.0	8.8	12.2	6.4	5.4	12.9	16.0
Others	Total	41.6	24.3	86.9	75.0	37.5	22.9	87.0	74.9
	Male	47.2	27.8	89.0	78.9	44.8	27.5	90.1	80.5
	Female	29.2	17.7	79.1	53.3	21.7	14.7	71.8	53.3

Source: Calculations based on Census of India data, 2001 and 2011

In towns of India, three-fourths of the working population are engaged in the tertiary sector (74.9%). The share of cultivators declined marginally with a simultaneous increase of agricultural labourers in small towns as observed in rural India. It is important to note that at the gender disaggregated level, a higher share of male workers is in other services as compared to their female counterparts, especially in small towns. On the other hand, a higher female participation is observed in the category of household workers which reflects less mobility of women outside the house.

An in-depth analysis across the various size classes of towns reveals that the share of cultivators and agricultural workers is lowest in Class II towns as compared to other size classes of towns. The highest

Table 4.19: Classification of Workers by Size Classes of Towns: 2011

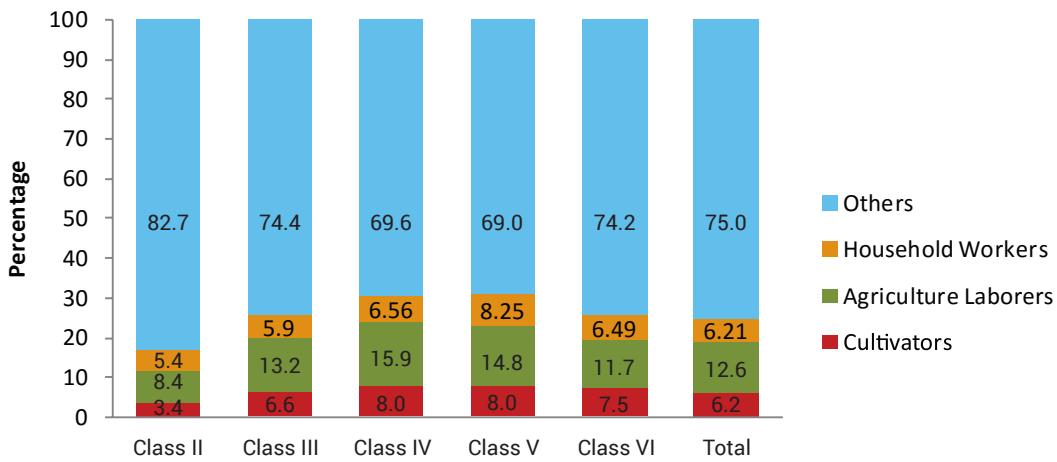

Classification		2011					
		Class II	Class III	Class IV	Class V	Class VI	Towns

Chart 4.8: Classifications of Workers by Size Classes of Towns: 2011

Source: Calculations based on Census of India data, 2011

proportion of cultivators and agricultural labourers was observed in Class IV towns followed by Class V towns in 2011. The share of household workers increases with the increase in size class except for Class VI which largely consists of industrial townships. An emerging pattern for this analysis is that the share of females among household workers is higher than males in all the size classes. The share of other workers has almost remained constant in small towns from 2001 to 2011. It is to be noted that the highest number of other workers are observed in Class II towns in both the decades – suggesting a higher share of non-farm job opportunities offered by large towns as compared to medium and small urban centres. With the only exception of Class VI towns, the proportion of other workers decreases systematically from Class II to Class V towns in both 2001 and 2011. Irrespective of size classes, other services are dominated by male workers (Table 4.20).

Economic Performance Index

An attempt has been made in this section to develop an economic performance index for the 5,705 towns in order to understand their overall economic performance. To arrive at such an index, a principal component analysis (PCA) has been used based on four parameters:

- (i) Work Participation Rate
- (ii) Share of main workers in total workers
- (iii) Share of other workers (main and marginal) in total workers
- (iv) Share of other workers (males – main and marginal) in total male workers

As per the economic performance index values analysis (Table 4.22), Gokak Falls (NAC), Karnataka, is the best town and Forest Village Lakhipathar (CT), Assam, the worst. Table 4.22 gives a representation of the five best and five worst towns in each of the size classes.

Table 4.21 brings out the fact that inequality in the economic indicators is also highest for towns followed by Class I non-metropolitan cities and metropolitan cities. This is true for all economic indicators. The

inequality in towns is the highest for 'Others' category of workers. Table 4.21 reveals that inequality between metropolitan cities and towns is nearly two times in terms of WPR and share of main workers while it is nearly five times in the 'Others' category of workers and 'Others' category of male workers.

Table 4.21: Inequality in Economic Indicators: Towns and Cities, 2011

Coefficient of Variation	WPR	Share of Main Workers	Share of Other Workers (Main and Marginal)	Share of Other Workers Male (Main and Marginal)
Metropolitan Cities	10.28	6.17	3.89	3.75
Non-metropolitan Class I Cities	12.47	6.32	9.77	8.62
Towns	19.66	12.94	26.26	23.45

Chapter 5

Case Studies: Raisen and Kurseong

Infrastructure financing is important to improve the level of services in urban centres. This is more pronounced in small towns where the level of services is low as compared to the large cities. This chapter attempts to make a detailed study of two towns, namely, Raisen and Kurseong. These towns were selected among the 5,705 towns for detailed case studies. Two similar sized towns were selected from a least-developed state and a less developed state¹ respectively in order to study the level of services and role of HUDCO project financing in these towns. HUDCO provides funds for housing and infrastructure development through State Housing Boards, Rural Housing Boards, Slum Clearance Boards, Municipal Corporations, Water Supply and Sewerage Boards and Improvement Trusts. This chapter attempts to study the socio-economic characteristics of towns which are covered by institutional funding.

A. Raisen

Raisen is a municipality town and the district headquarters in the state of Madhya Pradesh. Raisen takes its name from the fort built on a sandstone hill, at the foot of which the town settles. Located on the Bhopal-Sagar highway, the town has many educational institutes and small units manufacturing television components. Spread over an area of 19.08 sq km, the town is divided into 18 municipal wards.

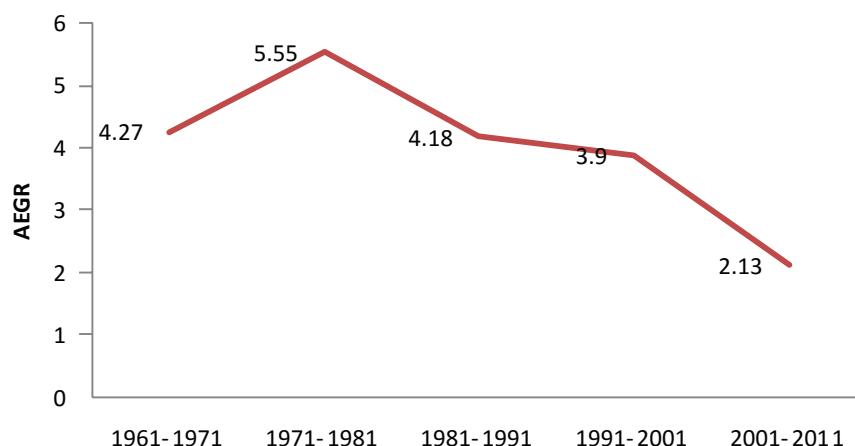

Amongst the 5,705 towns of India in 2011, Raisen ranks 590th in terms of its population size in 2011 and falls in Class III category of towns. As per Census 2011, Raisen has a population of 44,162. To study its demographic growth, Table 5.1 traces data from 1911. The table reveals that Raisen registered high demographic growth during the sixties and seventies. Since the eighties, however, there has been a declining trend in its growth rate. In the decade 2001-2011, the town experienced a growth rate of 2.13 per cent (Chart 5.1), but an absolute addition of people was only 8,460 in these 10 years. The growth rate of Raisen is nearly the same as of urban Madhya Pradesh (2.29%) but is higher than the growth rate of Class III category of towns (1.75%).

¹ Classification based on report of the committee headed by the then chief economic advisor Mr. Raghuram Rajan (ex RBI governor) which was set up by the government in 2013 to suggest a new methodology for devolving funds on states based on a 'multi dimensional index (MDI)'. The 10 states that score above 0.6 (out of 1) on the composite index have been classified as 'least developed', the 11 states that scored from 0.4 to 0.6 are 'less developed' and the seven states that scored less than 0.4 are 'relatively developed'.

Table 5.1: Population Growth Trends: Raisen, 1911-2011

Population (in numbers)										
2011	2001	1991	1981	1971	1961	1951	1941	1931	1921	1911

Table 5.2: Social Indicators: Raisen, 2011

	Sex ratio	Child sex ratio (0-6 years)	Literacy rate			Male-female gap in literacy rate
			Persons	Males	Females	
Raisen	922	931	82.0	87.7	75.8	11.9
Class III	939	909	79.7	85.9	73.1	12.8
Average for Towns	939	912	80.2	86.3	73.7	12.6

Source: Calculations based on Census of India data, 2011

In Raisen, the social indicators are better as compared to the average of 5,705 towns and Class III towns, the only exception being the sex ratio (Table 5.2). The sex ratio and child sex ratio work out to be 922 and 931 as against the average for the all towns which are 939 and 912 respectively. The male, female and overall literacy rates are also better than the average for all towns. Raisen has an overall literacy rate of 82.0 per cent. The male literacy rate is 86.3 per cent and female literacy rate stands at 75.8 per cent. The male-female gap in literacy rates is 11.9 per cent.

Table 5.3 reveals that in Raisen town, the work participation ratio is quite low as compared to the average of all towns and Class III category of towns. The WPR in Raisen is only 29.6 per cent as compared to 35 per cent in all towns. The male and female WPR is 47.7 per cent and 9.9 per cent respectively. The value for this indicator for all towns is 52.6 per cent for male and 16.2 per cent for females (Chart 5.2).

In Raisen, 87.4 per cent of the working population is engaged in the tertiary sector which is higher as compared to the average of all towns and Class III category towns. The value for the indicator is 74.9 per cent for the average of all towns and 74.3 for Class III category towns. The share of cultivators and agriculture labourers is 4.8 and 5.0 per cent respectively, which is lower than the average of towns and Class III categories. It is important to note that a higher share of female workers is in the categories of agriculture labourers and household workers as compared to their male counterparts (Table 5.4). This reflects more involvement of family labour in economic pursuits in the form of disguised employment.

Table 5.3: Work Participation Rate: Raisen, 2011

Town	Total	Male	Female
Raisen	29.6	47.7	9.9
Class III Towns	34.1	51.7	15.4

	Female	83.64	61.23	53.31

Source: Calculations based on Census of India data, 2011

Chart 5.2: Work Participation Rate: Raisen, Class III Towns and All Towns

Source: Calculations based on Census of India data, 2011

The report of the Technical Group on Urban Housing Shortage (TG-12) for the period 2012-17 has estimated that as of 2012, Madhya Pradesh faced a housing shortage of 3.07 million or 16.3 per cent of the total shortage of 18.78 million in urban India. No agency has estimated housing shortage exclusively for Raisen, as revealed through discussions with officials during the study tour. It was found from Raisen Municipality that there is a housing deficit for the EWS/LIG classes in town. There are approximately 5,000 such families. The shortage of housing is attributed to congestion and poor condition of housing.

The status of basic infrastructure is comparatively better in Raisen town than the average of the 5,705 towns and Class III categories of towns in terms of access to safe drinking water, tap water, electricity and toilets. However, the performance of Raisen is comparatively poor with regard to access to water within premises,

Box 5.1: Role of HUDCO in Raisen

The HUDCO regional office in Madhya Pradesh reports extensive assistance being provided for schemes pertaining to water supply and roads and bridges in towns of Raisen district. In Raisen town, HUDCO has financed one water supply scheme under Mukhyamantri Sahari Payjjal Yojana in 2011-2012. Also, an infrastructure development scheme under the Chief Minister Infrastructure Development Scheme is expected to be financed shortly.

The total cost of the scheme under Mukhyamantri Sahari Payjjal Yojana is Rs 28.98 crore. HUDCO has provided a loan of Rs 23.22 crore at a floating rate of interest of 10.5 per cent in the year 2011-12 for a period of 15 years. The state government will repay 75 per cent of the total loan (Rs 17.41 crore) while Raisen municipality will repay the remaining 25 per cent (Rs 5.80 crore).

The water supply scheme financed by HUDCO aims at creating a new water supply system for Raisen town. The scheme has been designed for a projected population of 1,16,600 for the year 2043. The raw water will be withdrawn from Halali Dam. The components of the scheme include construction of intake well, raw water pump house; providing, laying, jointing of raw water mains; construction of rapid sand gravity filter along with clear water pump; providing, laying, jointing of clear water mains; constructing clear water feeder main; construction of overhead tanks; water distribution network; providing HT feeder. The completion date of the project was December 2015, but till date only 80 per cent of the work is complete. Obtaining clearance and no objection certificates from Madhya Pradesh Road Development Corporation Ltd and Madhya Pradesh Madhya Kshetra Vidyut Vitaran Company Limited (MPMKVVCL) and construction of intake well at Halali Dam by the irrigation department caused a delay in completion of the project.

HUDCO will be financing another infrastructure development scheme under the Chief Minister Infrastructure Development Scheme shortly. The total project cost is Rs 10.01 crore. HUDCO will be providing a loan of Rs 7.01 crore and the state government will provide a grant of Rs 3.0 crore. The scheme aims at construction of Reinforced Cement Concrete (RCC) drains in wards 9, 10, 17 and 18; BT roads in wards 9, 10, 12, 13, 14 and 17; CC roads in wards 10, 13, 17 and 18; and parking and green areas in wards 10 and 17.

drainage and access to toilet facilities connected with piped sewerage. In Raisen, access to safe drinking water is as high as 93.81 per cent but access to water within premises is only 57.36 per cent as compared to 78.4 per cent in the all towns of India and 79.5 per cent in Class III towns respectively. The share of households which have tap connections is 70.42, which is better compared to the average of all towns and Class III towns. The other households in Raisen have handpumps installed in the premises which serve as a major source of drinking water. In terms of access to sewerage and sanitation also, Raisen is better as compared to the average of towns and Class III categories (Table 5.5). As per Census 2011, 74.63 per cent of the households in Raisen have a toilet facility within premises, but only 3.46 per cent households have flush toilets connected to the sewer system. Open defecation is practised by 24.5 per cent of the households and only 1 per cent of the households use public toilets. The corresponding figures for all towns are 69.4 per cent and 11.2 per cent respectively. In Raisen 72.3 per cent of the households have a waste water outlet connected to drainage while only 16.8 per cent of the households are connected to closed drainage. In all towns, 70.4 per cent households have a waste water outlet connected to drainage and 21.9 connected to closed drainage.

Table 5.5: Basic Infrastructure Indicators: Raisen, 2011

Indicators	Raisen	Average Class III	Towns
Access to safe drinking water	93.81	79.49	78.4
Source of drinking water within premises	57.36	62.1	59.7
Source of drinking water from tap	70.42	62.3	61.7
Electricity as the main source of lighting	88.79	84.60	85.93
Households having toilet facility within the premises	74.63	69.27	69.4
Households practice open defecation	24.5	25.95	25.82
Households having flush toilet facility with piped sewer within the premises	3.46	10.78	11.2
Households having waste water outlet connected to drainage	72.32	73.34	70.38
Households having waste water outlet connected to closed drainage	16.82	21.61	21.90

Box 5.2: Development Projects in Raisen

The Raisen Municipality is preparing a detailed project report for a housing project under Pradhan Mantri Awas Yojana (PMAY) for construction of 1,000 dwelling units. The scheme will be formulated under the two verticals: Affordable Housing in Partnership with Public and Private sectors, and subsidy for Beneficiary-Led Individual House Construction. The scheme will primarily be for slum dwellers of wards 11, 13 and 14.

The Raisen Municipality also aims to construct 1,000 toilets under Chief Minister Sahari Swachta Mission (now subsumed under Swachh Bharat Mission). The construction of 769 toilets has been completed.

The Raisen Municipality is further implementing a sanitation project funded by the European Commission. The commission has provided a grant of Rs 10 crore for construction of waste disposal trenching ground, deepening of pond and beautification around the pond, construction of drains and public toilets in slum areas.

Water supply to the entire town is provided by the Raisen Municipality. At present the source of water supply is the river Betwa. The existing water supply system was commissioned in 1964 by the Public Health Engineering Department (PHED) and was then handed over to the municipality in the year 1977. The present intake-well gets submerged during the monsoon and becomes non-operational for 3-4 months. Also, during the monsoon season, the distillery factory at Setganj releases waste water in Jogikar Nallah which meets the river Betwa at Makoria village, making the water non-potable. During this period the only source of water for the entire town is tubewells.

The quantity of potable water supply required as per norms of 135 litres per capita daily works out to be 5.9 million litres per day (MLD). Demand for non-potable water is additional. However, at present only 3.0 MLD of water is available from various sources. This amount reduces to 2.50 MLD water after treatment. Considering 20 per cent as transmission loss, on an average 48 lpcd of water is supplied to the Raisen Municipality. The entire town is covered with a distribution network. There are approximately 3,900 domestic connections. The water from the 27 tubewells is directly supplied, whereas the water from the river Betwa is pumped to the overhead tanks for further distribution. The water is supplied on an average for one hour daily. The user charges are raised on a flat rate basis which is Rs 60 for residential connections and Rs 120 for commercial connections per month. The Raisen Municipality has raised the user charge demand of Rs 2.0 crore for the year 2015-16. However, they have been able to collect only Rs 1.5 crore (75%).

B. Kurseong

Kurseong is a sub-divisional town situated in the Darjeeling district of West Bengal. Located 47 km from Siliguri, the town is connected to the city by road and the Darjeeling Himalayan Railway. The economy of the town is based mainly on residential schools and tourism. Kurseong Municipality is over 135 years old and is one of the oldest urban local bodies in the state of West Bengal. It was established in the year 1879 and later in 1890 Kurseong became a sub-division of the Darjeeling district. At that time the district was part of Rajsahi Division which is now in Bangladesh.

The local name of Kurseong is 'Kharsang' which in the Lepcha language means 'Land of the White Orchids'. Kurseong was ceded to the British empire by the Chogyal (monarch) of Sikkim in 1835. Later in 1880, the small hamlet became a tourist destination for the colonial authorities and was a preferred place for tuberculosis sanatoriums where the sick would recuperate.

According to Census 2011, Kurseong is a municipality, spread in an area of 7.85 sq km and comprises 20 wards. It has a population of 42,446 and therefore falls in the Class III category. Kurseong is currently at 623th position in the list of the 5,705 towns of India, arranged in order of their population sizes.

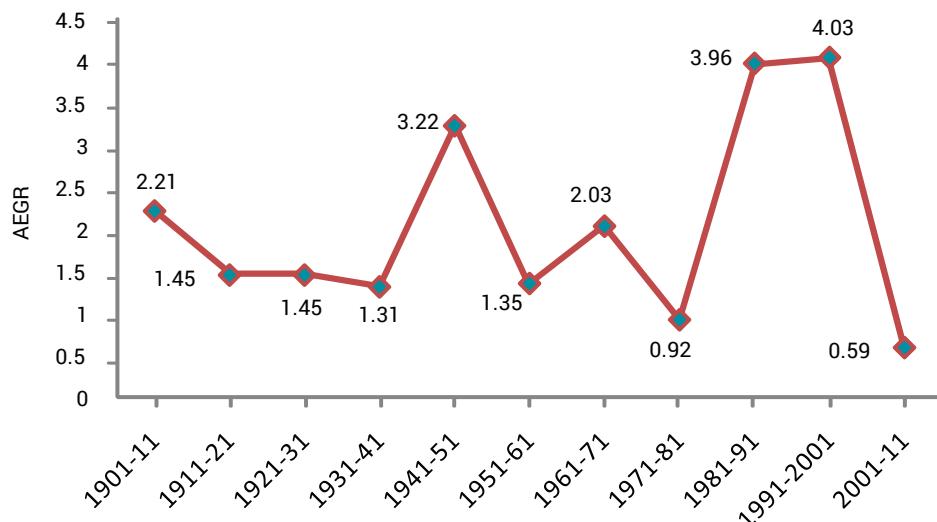

Table 5.6 and Chart 5.3 show that Kurseong has experienced fluctuations in demographic growth during the past few decades. In the last decade, Kurseong has seen an addition of only 2,427 people. It saw a phenomenal decline in the growth rate from 4.03 in 1991-2001 to 0.59 in 2001-2011. Lack of employment opportunities in the town explains the sluggish growth of the town. Also, the political turmoil witnessed in recent years resulted in out-migration.

Kurseong has been a slow growing town due to many factors. As indicated earlier, the emergence of Kurseong as a town took place in response to particular needs of the colonial administration, which was not conducive

Table 5.6: Population Distribution and Growth: Kurseong, 1901-2011

Population												
2011	2001	1991	1981	1971	1961	1951	1941	1931	1921	1911	1901	
42,446	40,019	26,758	18,008	16,425	13,410	11,719	8,495	7,451	6,445	5,574	4,469

Source: Calculations based on Census of India data, various years

to attract large-scale urban development. Secondly, the roads and railways geared mainly to service the tea industry proved much less effective in giving rise to large nodes taking urban forms. Thirdly, improved access coupled with improvement of the regional economy through the introduction of the tea industry, replacement of shifting cultivation by improved methods of agriculture dealing with a greater variety of crops, and better management of forests giving a much higher return did not result in the growth of the town to a considerable extent. In addition, political unrest in the region resulted in outmigration of people from the town.

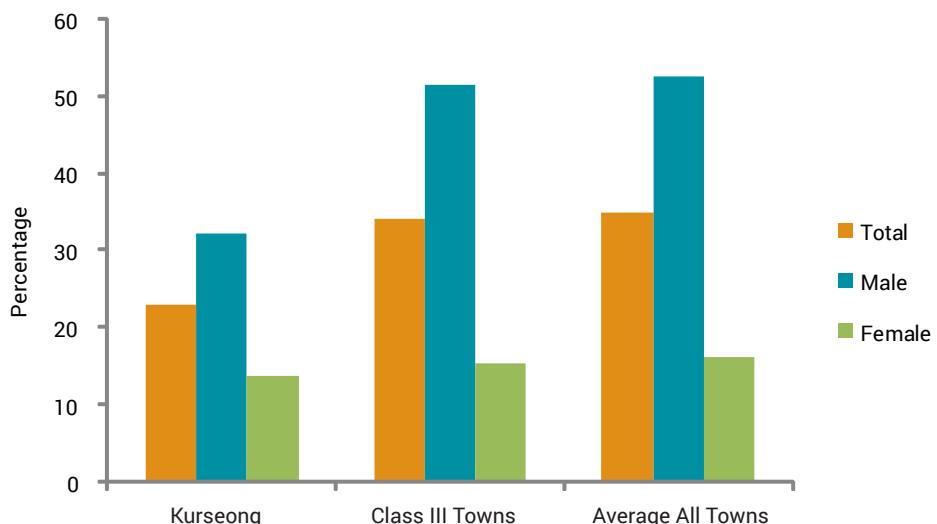

Table 5.7 and Chart 5.4 reveal that in Kurseong, the work participation rate is quite low as compared to the average of all towns and Class III category of towns. The WPR in Kurseong is only 23.3 per cent as compared to 35 per cent in all towns. The male and female WPR are 32.4 per cent and 13.9 per cent respectively. The value for the indicator for all towns is 52.6 per cent for males and 16.2 per cent for females.

In Kurseong, 96.03 per cent of the working population is engaged in the tertiary sector, which is very high as compared

Table 5.7: Work Participation Rate: Kurseong, 2011

Town	Total	Male	Female
Kurseong	23.2	32.4	13.9
Class III Towns	34.1	51.7	15.4
Average All Towns	35.0	52.6	16.2

Source: Calculations based on Census of India data, 2011

to the average of all towns and Class III category towns. The value for the indicator is 74.9 per cent for the average of all towns and 74.3 for Class III category towns. The share of cultivators and agriculture labourers is 0.25 and 0.49 per cent respectively, which is lower than the average of towns and Class III categories (Table 5.8).

In Kurseong, as revealed from Table 5.9, the social indicators are better as compared to the average of the 5,705 towns and Class III towns with the only exception being in the child sex ratio. The sex ratio and child sex ratio are placed at 981 and 869 as against the average for the all towns which stands at 939 and 912 respectively. The male, female and total literacy rates are much better than the average for all towns and Class III towns. Kurseong has an overall literacy rate of 93.7 per cent. The presence of several residential schools may explain this. The male literacy rate is 95.5 per cent and female literacy rate stands at 91.9 per cent. The male-female gap in literacy rates is 5.6 per cent.

Table 5.8: Classifications of Workers: Kurseong, 2011

Classification		Kurseong	Class III	Towns
Cultivators	Total	0.25	6.58	6.20
	Male	0.16	6.72	6.22
	Female	0.48	6.09	6.13
Agriculture Laborers	Total	0.49	13.15	12.62
	Male	0.49	10.97	10.39
	Female	0.49	20.97	20.35
Household Workers	Total	2.33	5.91	6.21
	Male	2.28	4.28	4.47
	Female	2.46	11.71	12.21
Others	Total	96.03	74.36	74.97

Average for Towns	939	912	80.2	86.3	73.7	12.6

Source: Calculations based on Census of India data, 2011

The Report of the Technical Group on Urban Housing Shortage (TG-12) for the period 2012-17 had estimated that as of 2012, West Bengal faces a housing shortage of 1.33 million or 7.08 per cent of the total shortage of 18.78 million in urban India. No agency has estimated the housing shortage exclusively for Kurseong, as revealed through discussions with officials during the study tour. However, 23.2 per cent of the households reside in slum areas in Kurseong. The town has taken up a housing project for construction of 526 dwelling units under the UIDSSMT component JNNURM (Box 5.4).

The status of basic infrastructure is comparatively better in Kurseong town than the average of 5,705 towns and Class III categories of towns in terms of access to safe drinking water, tap water, electricity and toilets. However, Kurseong's performance is comparatively poor with regard to access to water within premises and closed drainage. In the town, access to safe drinking water is as high as 79.65 per cent but access to water within premises is only 50.02 per cent. Comparatively, access to safe drinking water is 78.4 per cent in all towns of India and 79.5 per cent in Class III towns. The share of households with tap connections is 79.30 per cent, which is better compared to the average of all towns and Class III towns. The other households in Kurseong directly draw water from springs which are the second largest source of drinking water (Table 5.10).

In terms of access to sewerage and sanitation also, Kurseong is better as compared to the average of towns and Class III categories (Table 5.10). As per Census 2011, 88.25 per cent of the households in Kurseong have a toilet facility within premises, but only 20.42 per cent households have flush toilets connected to the sewer system. Open defecation is practised by 1.7 per cent of the households and 10 per cent of the households use public toilets. The corresponding figures for all towns are 69.4 per cent and 11.2 per cent respectively. In Kurseong 91.09 per cent of the households have a waste water outlet connected to drainage, while only 17.23 per cent of the households are connected to closed drainage. In all towns 70.4 per cent households have a waste water outlet connected to drainage and 21.9 connected to closed drainage.

Box 5.3: Role of HUDCO in Kurseong

HUDCO financed one scheme in Kurseong town for urban housing in the year 1990-91. The total project cost was Rs 18.42 lakh for construction of 45 dwelling units. HUDCO sanctioned a loan of Rs 11.88 lakh (65%) for a period of 15 years on state guarantee.

Table 5.10: Basic Infrastructure Indicators: Kurseong, 2011

Indicators	Kurseong	Average Class III	Towns
Access to safe drinking water	79.65	79.49	78.4
Source of drinking water within premises	50.02	62.1	59.7
Source of drinking water from tap	79.30	62.3	61.7
Electricity as the main source of lighting	96.81	84.60	85.93
Households having toilet facility within premises	88.25	69.27	69.4
Households practise open defecation	1.7	25.95	25.82
Households having flush toilet facility with piped sewer within premises	20.42	10.78	11.2
Households having waste water outlet connected to drainage	91.09	73.34	70.38
Households having waste water outlet connected to closed drainage	17.23	21.61	21.90

Source: Calculations based on Census of India data, 2011

Box 5.4: Development Projects in Kurseong

A housing project was sanctioned under JNNURM (IHSDP) scheme for construction of 565 dwelling units in 2008. The total project cost was Rs 11.99 crore. The scheme is complete and all the dwelling units have been allotted.

A sewerage project was sanctioned under the UIDSSMT component of JNNURM. The total project cost was Rs 12.5 crore. The central government sanctioned a grant of Rs 10.01 crore. The state and ULB contributed Rs 1.2 crore each.

Under the Housing For All Mission, 2,121 dwelling units (DUs) are to be constructed by 2022 under the fourth pillar, namely, beneficiary led construction. Here, the contribution of the beneficiary is Rs 25,000, including land; centre share – 1.5 lakh; state share – 2.5 lakh; ULB share – 5 per cent. During the year 2015-16, 164 DUs have been sanctioned.

There is a proposal to build a two-level parking space and a market to generate revenues through these initiatives.

In Kurseong, the storage and augmentation of water is the responsibility of the Public Health Engineering Department, and the entire distribution system is managed by the municipality. The daily demand of potable water is about 3.1 MLD but in the lean period from March to June, only 1.09 MLD is available for distribution. During the dry season, water is supplied on alternate days and at times, distribution of water has to be made through tankers and trucks.

Kurseong town has quite a large number of perennial and semi-perennial sources of water in the form of hilly streams. Water from the streams, which are also known as nullahs and jhoras, is stored in small setting tanks and reservoirs. Out of the 20 wards, wards 1-4, 5 and 6 had access to perennial sources. Of late, these wards have also faced water shortage in summer due to a dearth of storage facilities. Rainwater harvesting, which has the potential of solving the water shortage problem in the town is conspicuous by its absence. Adoption of the measure would solve the water supply problem. As Kurseong has natural sloped areas, the gravity flow system has been adopted for channelling and distribution of water to different places. Kurseong Municipality has neither tubewells nor any pumping stations and all the water is directed to the primary reservoirs after preliminary sedimentation of filtration through different sizes of G.I. pipe lines from their respective natural spring sources located at a distance ranging from two to 20 km from Kurseong.

Discussions with the municipal officials revealed that due to the existence of age-old reservoirs and leaking pipes of different sizes laid during the British regime, the municipality is facing acute problems in distribution of water. The estimated loss of water due to leakage is about 30 per cent. There is a need for restoration of a catchment area, replacement of leaking supply pipes, laying new water supply lines with modern technology, construction of new water reservoirs at different places, and implementation of a water harvesting system in order to overcome the problem of shortage of water supply.

Discussions during the field visit also revealed that earlier the solid waste generated was simply dumped in nearby places, as the waste generated was mainly organic and degradable. Gradually, however, with the increase in population, the quantity of waste generated increased and included non-bio-degradable materials like plastics, glass, etc. Thereafter, collection bins were installed at different locations. Presently, waste is disposed off by the households in collection bins nearby. The conservancy staff of the municipality then collect and dispose it in a dumping ground. The collected wastes are directly transported to the dumping ground without any treatment. At present the municipality has about 65 conservancy staff to look after both the liquid and solid waste system. The municipality does not have a proper disposal site with the latest technology. Also, a door-to-door collection system and segregation of wastes at the source is yet to be established in Kurseong. A waste disposal system has to be put in place and a gas based crematorium is proposed to be constructed at a dumping site in the town.

The two cities Kurseong and Raisen are similar sized towns in terms of population but present different pictures with respect to their demographic, social and basic infrastructure parameters. On the scale of the infrastructure index, Kurseong (0.592) is at the 1,137th rank in comparison to Raisen (0.165) at the 2,135th rank. On the social development index Kurseong (1.471) is at the 141st rank in comparison to Raisen (0.205) at the 2670th rank. The differential performance of these cities points to the disparity in the level of development of the states which impacts on the performance of towns directly.

Government initiatives for devolution of powers to local governments to make them self sufficient has facilitated the creation of elected urban local bodies even in these towns, but many of them do not have the capacity, or even the knowledge, to use the powers they have to improve conditions in their towns. Also, the functional devolution to ULBs has not been supported by adequate transfer of revenue sources. Many of the ULBs have a weak financial status and therefore are unable to mobilise resources on their own for any kind of infrastructure development. For example, Kurseong Municipality does not collect a property tax in the town. There is widespread opposition from residents with regard to imposition of this tax. Also, water and sewerage charges are not yet imposed. At present, there is no metering system in the town with regard to water supply. In such a scenario, efforts should be made to improve the local revenue base of the town. A holistic approach should be adopted to improving the economic and infrastructure condition of small towns.

Chapter 6

Census Towns

India is witnessing a slow progress towards urbanisation. While one in every sixth person in the world lives in India, one in every ten global urban citizens resides in Indian urban spaces. Population projections for the next four decades show that by 2050, there will be an addition of further 497 million Indian urban inhabitants to the existing urban population of 377.1 million, which is going to be the largest among all nations in the world.¹ According to other estimate, India's urban population is expected to touch 814 million by 2050 or 50 per cent of the total population in that period.²

As per Census of India, all places administratively declared urban areas by a state law, that is, a municipality, corporation, cantonment board or notified town area committee etc. are considered as Statutory Towns. On the other hand, Census Towns are all other places categorised as urban areas by the Registrar General of India, which satisfy the following criteria: (i) a minimum population of 5,000; (ii) at least 75 per cent of the male main workers engaged in non-agricultural pursuits; and (iii) a density of population of at least 400 per sq. km.

Local Government is a state subject figuring as item 5 in List II of the Seventh Schedule to the Constitution of India. Three types of the Urban Local Bodies, namely, Nagar Panchayats, Municipal Councils and Municipal Corporations have been categorised under the provision of Article 243Q of the 74th Constitutional Amendment Act (CAA). Quantitative dimensions for area or population have not been clearly hinted for their identification. Several states have specified their own criteria for the purpose. A quick review of the provisions in some states in this regard is presented in Table 6.1.

Statutory Towns are thus constituted under the respective State Nagar Palika/Municipal Acts in India. This is often the outcome of political preferences. This is reflected in the definition of statutory towns in various states where the choices to declare a region as urban have been subject to the value judgement of political executives to a considerable extent. As a result, a good number of areas which classify as Census Towns may remain under the rural administration and are not recognised as 'urban' by the respective state government.

During 2001-2011, the numbers of census towns have increased by more than 185 per cent whereas the numbers of statutory towns have increased merely around 6 per cent during the same period of time.³ In

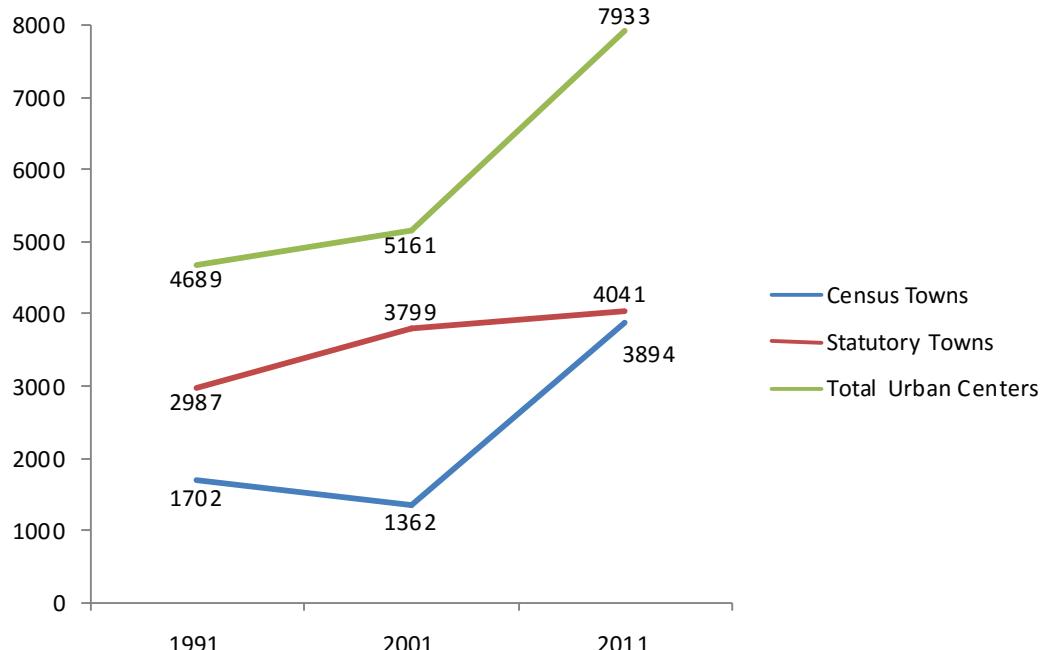

¹ United Nations projections, 2012.

² World Economic Forum. The Future of Urban Development & Services: Urban Development Recommendations for the Government of India. April 2015.

³ Calculations based on data from Census of India, 2011.

Table 6.1: Criteria Followed by States for Constituting Statutory Towns: Selected States

State	Population	Density	Occupation	Income of local body (Rs./ annum)
Model Municipal Law, Government of India	25,000	Not specified	Non-agricultural > or = 85 per cent	Local revenue generation listed as a criterion but no figures stated
Andhra Pradesh	40,000	Not specified	Not specified	Rs. 60 Lakhs
Karnataka	20,000	Not specified	Not specified	Rs. 9 Lakhs per annum
Kerala	Not specified	Not specified	Not specified	Not specified
Maharashtra	25,000	Not specified	Not specified	Not specified
Tamil Nadu	Not specified	Not specified	Not specified	Not specified
West Bengal	30,000	750 persons per sqkm	Non-agricultural > or = 50 per cent of adult population	Not specified

Chart 6.1: Number of Census and Statutory towns in India: 1991, 2001 and 2011

Source: Calculations based on Census of India data, various years

2011, 54.3 million urban dwellers were living in CTs, accounting for 14.5 per cent of the urban population. The new 'census towns' are currently under rural administration and have to be declared as 'statutory towns' by the respective states. This chapter attempts an analysis of socio-economic conditions of census towns vis-à-vis statutory towns. Here all 7,933 towns and cities have been considered in the analysis.

The major revelation in Census 2011 came with the number of census towns growing from 1,362 to 3,894, while the figure for statutory towns increased slightly from 3,799 to 4,041 (Chart 6.1). The sudden increase in the number of census towns has drawn attention to this class of settlements. The interest in census towns was earlier restricted as their share in the total urban population was as low as 7.4 per cent in 2001 and their

numbers were increasing slowly.⁴ Thus, the country as a whole is becoming urbanised at a faster rate than it is recognised by the states. The level of urbanisation of the country will come down to 28.9 per cent, if the incremental population of the census towns is deducted. This will bring down the urban growth rate to 2.02 per cent.

In terms of distribution of the census towns across states, the state with maximum number of census towns as per the Census 2011 is West Bengal (780) followed by Kerala (461), Tamil Nadu (376) and Maharashtra (279). These four states along with Uttar Pradesh (267) and Andhra Pradesh (228) account for more than 60 per cent of the census towns in India as per Census 2011. It has been observed that more than 90 per cent census towns were considered as villages in Census 2001 and only about 15 per cent census towns have got statutory status either by recognition or merging. The calculations based on Census figures have also brought out that percentages of statutory towns among the total towns have shown a decreasing trend in the major states. States with notably lowest percentages of statutory towns are Kerala (11.35), West Bengal (14.19) and Andhra Pradesh (35.41) in 2011 (Table 6.2).

Distribution of Census Towns across size class

Distribution of census towns (CTs) as per Census 2011 across six size classes reveals that maximum number (1,713) or the highest percentage of CTs (44.01%) are Class V towns, followed by Classes IV, III, VI, II and I with 1,148, 593, 364, 54 and 20 respectively. Chart 6.2 shows the size class distribution in terms of percentages of CTs falling under each class.

While Class I CTs were 10 during Census 2001, the number has doubled in 2011. There are 20 such CTs where population is more than 1 lakh. Class II CTs have increased more than 86 per cent with respect to 2001 (from 29 in 2001 to 54 in 2011) while Class III CTs have increased around 162 per cent since 2001 (from 226 in 2001 to 593 in 2011). The number of CTs has seen a high increase for Class V and VI towns (more than 200 per cent for both the size classes). Class IV CTs have also shown more than 150 per cent increase in number during this period (Table 6.3).

Distribution of statutory towns (STs) across size classes in 2011 reveals that the highest number of STs (1,320) are in Class III towns followed by 1,089 Class IV STs. Class III and IV clubbed together cover almost

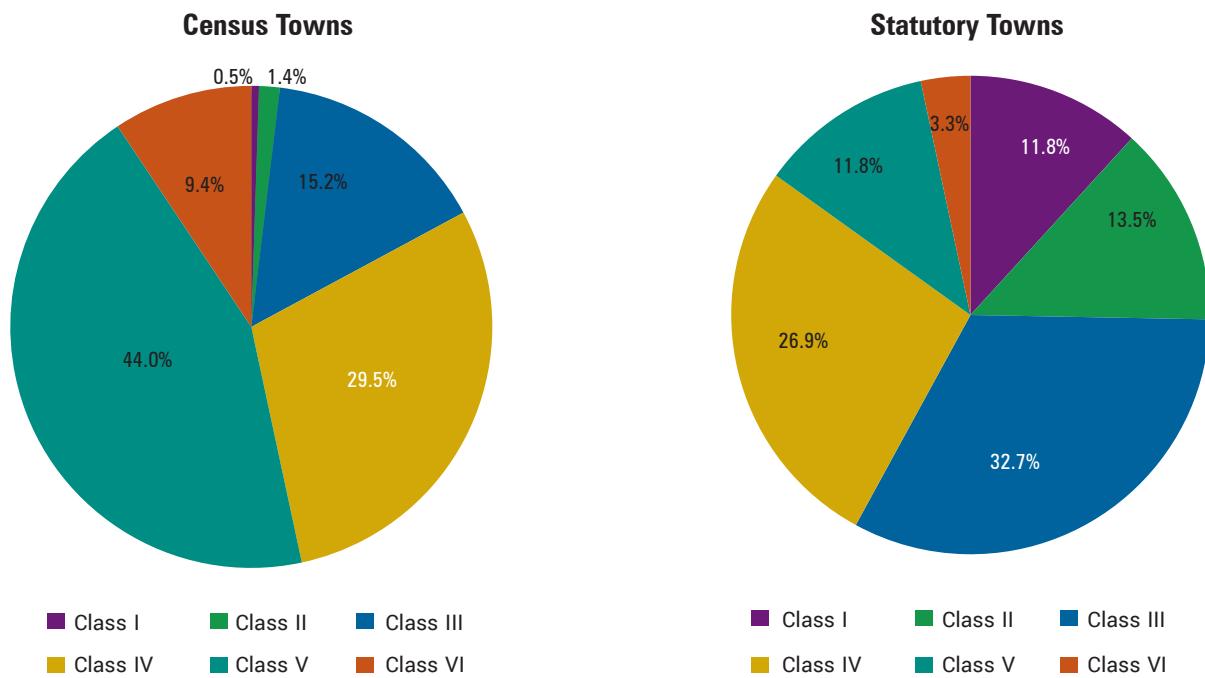

Table 6.2: Percentage of Statutory Towns among Total Towns

Source: Calculations based on Census of India data, 2001-2011

60 per cent STs recorded during Census 2011. While around 12 per cent STs are Class I towns and another 12 per cent are Class V towns, 13.5 per cent STs fall under Class II categories. As expected, only 3.3 per cent STs are recorded under Class VI town categories. It is to be noted here that Class VI STs are mainly small industrial towns or cantonment boards or other towns classified as ST for special administrative purposes/reasons only (Table 6.3).

Demographic Profile

It has been observed that 318.5 million urban dwellers in India reside in STs across size classes accounting for 85.5 per cent of the total urban population in 2011. In 2001, 259.9 million people lived in statutory towns and cities.

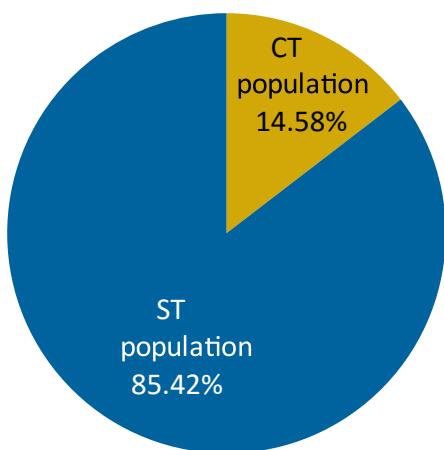

Again, 54.3 million urban dwellers in India live in CTs across all size class, which stands around 14.5 per cent of the total urban population as per Census 2011 (Chart 6.3). Thus, around one in every seven urban citizens in India is residing in CTs and being administered by gram panchayats. As per Census 2001, 21.15 million people lived in CTs, which accounted for 7.5 per cent of the total Indian urban population in 2001.

Except for Classes IV and V, all other classes of STs have shown an increase in population during the decade 2001-2011. The maximum increase in ST population (approximately 28.8 per cent over 2001 figures), which is 49.2 million in absolute numbers, has been noted in Class I cities, where economic opportunities are better.

Class III CTs recorded a maximum increase in population followed by Class IV and V respectively (Chart 6.4). More than 10.75 million people have been recorded under Class III CTs. While slightly more than 9.5 million people have been added under Class IV CTs in 2011, around 8.2 million more people have been recorded against Class V CTs in 2011 in comparison to 2001. Class I CTs have recorded an addition of 2.1 million people, Class II CTs recorded 1.4 million and Class V CTs have seen an increase in 1.1 million people.

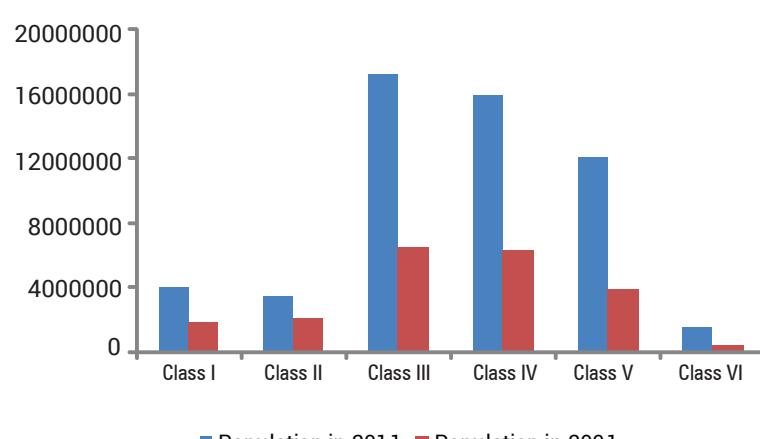

Around 2 per cent of the population of Class I towns are in CTs which accounts for almost 4 million population. Of the Class II towns, 3.5 million (8.5 per cent) population dwells in CTs. While almost 30 per cent (17.2 million) of the Class III town populations dwell in CTs, nearly half of Class IV towns are based in CTs. Furthermore, around 76 per cent, (12.1 million) of the population of Class V and 80 per cent, (1.6 million) of Class VI towns are accounted for by CTs (Table 6.4 and Chart 6.5).

Chart 6.7: Average Exponential Growth Rate 2001-2011: CTs, STs and Urban India

Source: Calculations based on Census of India data, 2001-2011

Among the CTs recorded in Census 2011, more than 60 per cent of the people live in Class III and Class IV towns put together (Chart 6.6). A high share of CT population is spread across Classes III, IV and V towns as per Census 2011.

The total CT population in 2011 has increased by more than 156 per cent with respect to that in 2001 while the total ST population in 2011 has increased by merely around 22.5 per cent in the same period.

As mentioned earlier, while the population in Class I STs in 2011 has increased around 28.8 per cent over Census 2001, the same for Class II STs has noted a 13.33 per cent rise, Class III STs have noted a 14.89 per cent rise, and Class VI STs have seen a 10.33 per cent rise over Census 2001 figures. The population in Class-IV and V STs has decreased in absolute numbers during the census decade 2001-2011.

Average exponential growth rates during 2001-2011 (Chart 6.7) for CTs, STs and all towns put together (urban India), across size class, show varied trends. Across all the size classes, CTs have exhibited much higher exponential growth rates compared to those in STs and urban India. Class IV and V STs have shown negative exponential growth rates during the last census decade.

Socio-economic Profile

Sex Ratio

The towns of India have an overall sex ratio of 939. Overall, the sex ratio of CTs (952) is better than STs (925) for 2011. The same pattern is witnessed in 2001 as well, although the gap has widened in the later decade. The sex ratio has improved for all categories of STs and CTs across size class in 2011 with respect to 2001 figures (Table 6.5).

Table 6.5: Sex Ratio: 2011 and 2001

Class Size	Census Towns		Statutory Towns		Urban India	
	2011	2001	2011	2001	2011	2001
Class I	869	837	917	888	916	887
Class II	898	876	950	923	946	920
Class III	993	922	942	925	957	925
Class IV	949	906	940	924	944	919
Class V	945	912	945	927	945	919
Class VI	931	895	876	825	920	863
Total	952	903	925	900	929	900

Source: Calculations based on Census of India data, 2001 and 2011

As discussed in Chapter 4, the sex ratio in towns has increased by 15 points from 2001 to 2011. Among the Class II to Class VI size class of towns, the highest sex ratio of 942 is observed in Class II and Class V categories. Class VI has the lowest sex ratio of 924 in spite of the significant increase of 58 points from 2001 (Table 4.2). The improvement has largely been observed in Classes V and VI, while Classes II, III, and IV have observed a moderate improvement.

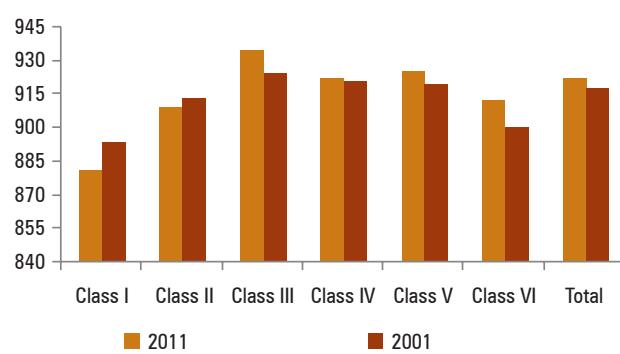

The sex ratio has improved to 925 from 900 for all STs during the period 2001 to 2011. On the other hand, for all CTs, it has improved from 903 in 2001 to

Source: Calculations based on Census of India data, 2001 and 2011

Literacy Rate

Literacy rates have improved across all size class of CTs and STs in 2011. The overall literacy rate in urban India has improved from 79.93 per cent (in 2001) to 84.14 per cent (in 2011). Amongst all the size classes of CTs, Class II and III CTs have exhibited relatively higher literacy rates in 2011.

While Class VI STs have exhibited the highest percentage of literacy rate (86.19%) in 2011 among all size classes of STs, Class III towns have shown the highest literacy rate (87.36%) among all size classes for CTs. A relatively higher literacy rate in Class VI STs can be attributed to the fact that most of those towns are industrial in nature built by public agencies for special purposes which generally attract relatively more educated/literate people.

In urban India, Class I towns have recorded the highest literacy rate compared to other size classes in 2011.

952 in 2011. The sex ratio has improved to 929 from 900 during the census decade 2001–2011 for urban India. In 2011, Class II STs reported the highest sex ratio of 950 while the lowest was observed in Class VI STs. This is understandable as Class VI towns are industrial establishments and cantonment boards with a higher share of engagement of male workers. Also, the male selective migration to Class I cities from classes II to V towns resulted in a higher share of females reported there. There is an improvement in sex ratio in CTs for lower order towns. Class II CTs report a low sex ratio of 898 as compared to Class V which reports 945 (Table 6.5).

A comparison of the child sex ratio between 2011 and 2001 across size classes for CTs and STs reveals inconsistent trends which do not correspond to trends in the general sex ratios (Table 6.6).

Child sex ratio in Class I and Class II CTs have dipped down in 2011 compared to 2001 figures, while other size classes of CTs exhibited improvements in child sex ratio in 2011. As a result, the same has improved considering all the CTs together (Chart 6.8).

The child sex ratio in Class I and Class III STs in 2011 has gone down compared to 2001. While Class II, IV and V STs have shown improvement in the child sex ratio in 2011, Class VI STs have maintained the same level in 2011 in comparison to 2001 figures (Chart 6.9).

Table 6.8: Work Participation Rate in CTs, STs and Urban India: 2011 and 2001

Class Size		Census Towns		Statutory Towns		Urban India	
		2011	2001	2011	2001	2011	2001

	Female	16.13	12.24	15.29	11.83	15.41	11.60

Source: Calculations based on Census of India data, 2001 and 2011

Class V towns have recorded the lowest literacy rates (80.59%) in 2011. Such a pattern is noted in both class V towns of CTs (81.09%) and STs (78.96%) (Table 6.7).

Work Participation Rate

Table 6.8 shows the work participation rate in 2011 vis-à-vis 2001 across all size classes for CTs and STs. Amongst the CTs, the highest work participation rate (36.07%) has been recorded in Class V towns. This size class also demonstrated the highest WPR (36.91%) for all urban India. Amongst the STs, the highest WPR (40.64%) has been exhibited in Class VI towns. This is because the Class VI towns are industrial townships or townships built by specific public agencies.

Amongst the CTs, in 2011 the highest male WPR (53.87%) has been recorded in Class IV towns while the highest female WPR (17.5%) has been recorded in Class V CTs. For STs, Class VI towns registered a higher male WPR with 56.92 per cent and Class V towns a female WPR with 23.97 per cent (Table 6.8).

Amongst the CTs, Class I towns recorded the lowest WPR in 2011. Class I CTs have recorded the lowest WPR for both male and females in 2011. Amongst the STs, Class III towns have been found to have the lowest total WPR and WPR for males in 2011. Class II STs have exhibited the lowest WPR for females in 2011.

STs have recorded a lower female WPR than that of CTs. The higher share of female employment in agriculture and allied activities or in household industries in CTs often in the form of disguised unemployment may explain this fact. On the contrary, STs have exhibited a higher male WPR compared to CTs. The total WPR in STs in 2011 is marginally higher than that in CTs considering all size classes.

Classification of Workers

Table 6.9 shows distribution of workforce as per Census 2011 across four major categories: cultivators, agriculture labourers, household workers and others. Across all six size classes of towns, STs have recorded a lower percentages of cultivators compared to those in CTs. All CTs across class size have recorded the presence of 3.11 per cent cultivators in 2011. All STs on an average have recorded 2.17 per cent of cultivators in 2011. The highest percentage of cultivators has been found to be present in Class V towns amongst STs (14.37%), in Class VI towns amongst CTs (5.44%), and in Class V towns for urban India (7.1%).

Again, all size classes of STs have recorded lower percentages of agricultural labourers than those in CTs in 2011. All CTs put together across size classes have recorded a higher percentage of agriculture labourers (6.83%) than that of STs (5.19%) in 2011. For STs, the highest percentage of agricultural labourers has been found in Class V towns (24.52%), and for CTs, the highest percentage of agriculture labourers has been found in Class VI towns (10.29%). In urban India, towns Class IV towns have registered a maximum percentage of agricultural labourers (13.53%) among all size classes.

STs have registered a higher percentage of household workers than those in CTs for Class I and Class II towns. But for Class III, IV, V and VI towns, CTs have recorded a higher percentage of household workers than those in STs in 2011. While amongst the CTs, the highest percentage of household workers (9.22%) has been found in Class V towns, among the STs, the highest percentage (5.73%) of household workers has been recorded for Class IV towns in 2011. In urban India, Class V towns have the highest percentage (8.09%) of household workers in 2011 amongst all size classes.

Table 6.9: Distribution of Workforce: 2011

		Class I	Class II	Class III	Class IV	Class V	Class VI	Total
Cultivators	Census Towns	1.10	1.29	2.19	3.49	4.63	5.44	3.11

Table 6.10: Work Participation Rate and Percentage Distribution of Main and Marginal Workers: 2011

Class	Census Towns			Statutory Towns		
	WPR	Main worker	Marginal worker	WPR	Main worker	Marginal worker
I	32.01	90.42	9.58	35.52	89.21	10.79
II	33.95	90.35	9.65	34.47	87.86	12.14
III	34.62	84.93	15.07	34.15	85.25	14.75
IV	35.97	84.59	15.41	36.47	83.70	16.30
V	36.07	82.47	17.53	39.63	81.40	18.60
VI	35.57	79.91	20.09	40.81	86.56	13.44
All	35.13	84.82	15.18	35.32	88.16	11.84

Source: Calculations based on Census of India data, 2001and 2011

Class I CTs have registered the highest percentage of 'others' category amongst all size classes of CTs, with 94.12 per cent. Consistently, Class I STs have recorded the highest percentage of 'others' category, across all size class of STs, with 92.53 per cent.

The preponderance of an agrarian economy in most of the CTs explains the above dynamics. Most of these towns have experienced sectoral diversification for the first time. This explains the higher WPR for women, which is basically in the form of disguised unemployment. Also, there is a higher share of workers engaged in all three industrial categories other than 'others' in CTs as compared to STs. The STs, on the other hand, have a higher share of workers in 'others' as these settlements have experienced sectoral diversification much before and show traits of non-farm specialisation.

CTs in 2011 have registered 84.82 per cent main workers and 15.18 per cent marginal workers. Among the CTs, Class I towns have the highest percentage of main workers (90.42%) while Class VI CTs have registered the highest percentage of marginal workers (20.09%) (Table 6.10).

STs in 2011 have recorded 88.16 per cent main workers and 11.84 per cent marginal workers. Compared to the CTs, STs have a higher percentage of main workers as per Census 2011 figures. Among STs, Class I towns have the highest percentage of main workers (89.21%) and Class V towns have the highest percentage of marginal workers.

Assets Holding

Considering availability of specific assets, the television and mobile phone have been found to be the two most popular assets in urban India. While 77.58 per cent of ST households have a television, for CT households, this figure is 71.65 per cent. Again, 64.87 per cent households have mobile phones in STs as per Census 2011 while 61.23 per cent of households have the same in CTs.

Among ST households, 13 per cent have either a television, computer/laptop, telephone/mobile phone and/or scooter/car as compared to 7.86 per cent of CTs. Class V STs have recorded the lowest ownership of such assets (3.79%) among all STs and CTs. Across all size classes, 6.71 per cent of households have reported having no asset such as a radio, television, computer, telephone, bicycle, scooter or car. In the CTs, 8.85 per

cent of such households have been found to own none of these assets.

Automobile ownership percentage is also quite significant in Indian urban areas. While 36.28 per cent of households own a scooter/motorcycle/moped in STs, 29.22 per cent of CT households own the same. Moreover, 10.2 per cent ST households own a car/jeep/van as against 7.18 per cent ownership by CT households.

Interestingly Class I CTs (with 12.84%) have exhibited a higher percentage of car/jeep/van owning households in 2011 than that of Class I ST households (with 12.02%). Except for Class I towns, CTs have recorded a higher percentage of households in every other size class to own a scooter/motorcycle/moped than those in ST households.

Among the CTs, Class V towns have the lowest percentage of households owning a two-wheeler (5.23%) and four-wheeler (25.37%). Among the STs, Class V towns recorded the lowest percentage (24.85%) of households owning two-wheelers and Class IV STs have the lowest percentage (5.01%) of households owning four-wheelers.

68.21 per cent of households in STs have been availing banking services as compared to 65.2 per cent of households in the CTs. Interestingly, except for Class VI towns, CTs have recorded higher percentages of households availing banking services in 2011 than STs for every other size class. Class VI STs have even recorded the highest percentage (72.56%) of households availing banking services in 2011 amongst STs and CTs. Thus, Class VI STs have come out with an even higher percentage of households than that of Class I STs in availing banking services.

On the other hand, Class IV STs have exhibited the lowest percentage of households (59.39%) availing banking services in 2011 with the highest being Class VI and second highest being Class I amongst all the size classes of STs.

Among the CTs, in 2011, Class V towns registered the lowest percentage of households (61.6%) availing banking services with the highest being Class I CTs (71.13%) and the second highest being Class III towns (66.93%).

Basic Infrastructure Facilities

In urban India, the percentage distribution of households by main source of drinking water, as per Census 2011, reveals that 70.63 per cent households are dependent on tap water; while 11.86 per cent households still use handpumps and 8.9 per cent use tubewells, 6.15 per cent, that is, the lowest percentage of households in urban India, use wells as the main source of drinking water (Table 6.11 and Chart 6.10).

Class I towns have reported the highest percentage of households (78.29%) who use tap water as their main source of drinking water; while Class V towns have recorded the lowest percentage of households (50.13%) who use tap water as their main source of drinking water.

The maximum use of handpumps (with 24.99 per cent of households) and tubewells (11.06 per cent) has been observed in Class V towns. Thus, almost half of the urban households residing in Class V towns depend

Table 6.11: Percentage Distribution of Households by Main Source of Drinking Water in Urban India: 2011

Size Class	Tap water	Well	Handpump	Tubewell	Others
Urban India	70.63	6.15	11.86	8.90	2.46
Class I	78.29	2.48	8.38	8.69	3.16
Class II	65.48	7.65	14.40	9.43	9.86
Class III	58.48	14.50	15.80	8.27	15.22
Class IV	56.62	12.16	18.75	9.78	13.81
Class V	50.13	11.00	24.99	11.06	13.35
Class VI	53.86	12.29	22.02	8.43	15.63

Table 6.12: Percentage Distribution of Households by Main Source of Drinking Water in Census Towns: 2011

Size Class	Tap water	Well	Handpump	Tubewell	Others
Census Towns Total	49.18	19.40	16.23	11.74	3.44
Class I	62.25	4.19	10.87	15.37	7.32
Class II	54.77	15.53	12.43	12.18	5.09
Class III	47.32	30.44	9.02	9.83	3.39
Class IV	49.66	17.18	17.67	12.45	3.05
Class V	45.87	12.41	26.61	12.70	2.41
Class VI	47.78	14.40	25.30	9.42	3.10

Source: Calculations based on Census of India data, 2011: Houses, Household Amenities and Assets

on an alternative source to tap water as the main source of drinking water. The highest percentage of households (3.69%) using wells as the main source of drinking water has been found in Class III towns.

Less than half of the households in CTs (49.18%) use tap water as the main source of drinking water; while 16.23 per cent households depend on handpumps and 11.74 per cent households still use tubewells, 18.39 per cent of households have recorded 'others' as the main source of drinking water in 2011 (Table 6.12).

In CTs, the highest percentage of households use tap water (62.25%) and tubewells (15.37%) in Class I towns. Each of the Class III, IV, V and VI CTs have reported less than half of the households who use tap water as their main source of drinking water.

Chart 6.10: Percentage distribution of Households by Main Source of Drinking Water in Urban India: 2011

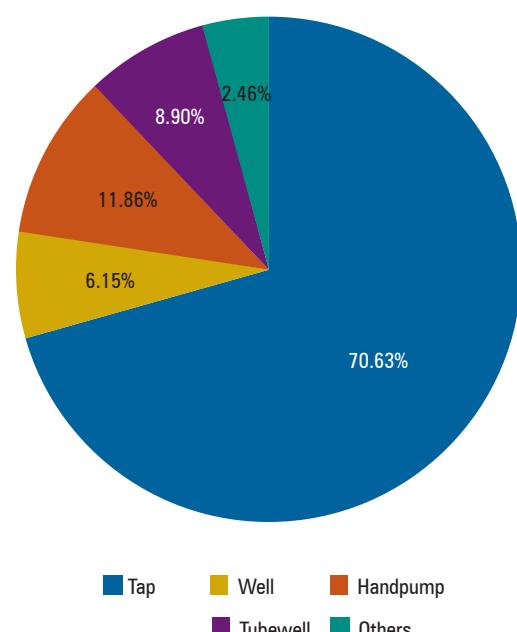

Table 6.13: Percentage Distribution of Households by Main Source of Drinking Water in Statutory Towns: 2011

Size Class	Tapwater	Well	Hand pump	Tubewell	Others
Statutory Towns Total	74.37	3.84	11.10	8.40	2.29
Class I	78.57	2.45	8.34	8.57	2.08
Class II	66.48	6.92	14.58	9.17	2.85
Class III	63.60	7.17	18.91	7.56	2.75
Class IV	63.76	7.02	19.86	7.04	2.32
Class V	63.73	6.78	19.84	5.84	3.82
Class VI	76.13	4.53	10.01	4.79	4.53

Source: Calculations based on Census of India data, 2011: Houses, Household Amenities and Assets

A significantly high usage of handpumps has been noted in Class V (26.61%) and Class VI (25.3%) CTs. Class III CTs in 2011 recorded an excessively high percentage of households (26.51%) reporting the use of 'others' as their main source of drinking water. Class III CTs have also reported the maximum percentage of households (30.44%) using wells as their main source of drinking water.

Usage of tap water is significantly higher in STs (74.34%) than that of CTs (49.18%) as per Census 2011 figures. The highest percentage of households (74.34%) reported using tap water as their main source of drinking water in STs. While the lowest percentage of households (3.84%) residing in STs have been found to use wells as their main source of drinking water, usage of handpumps has been noted to be as much as 11.1 per cent of households in STs. Tubewells have been used as the main source of drinking water by 8.4 per cent households residing in STs. Almost 2.29 per cent households, across all ST size classes, still use drinking water from 'other' sources (Table 6.13).

Class I STs have reported the highest percentage of households (78.57%) using tap water as their main source of drinking water followed by Class VI STs (76.13%). Class III, IV and V STs have a relatively lower usage of tap water than other size classes of STs.

Class IV (19.86%), Class V (19.84%) and Class III (18.91%) STs have a significantly high percentage of households who use handpumps as their main source of drinking water as per Census 2011. Class II STs have the highest percentage of households (9.17%) using tubewells as their main source of drinking water.

The percentage distribution of households according to distance of main source of drinking water has been classified under three categories: within premises, near premises and away from the premises. More than 71 per cent of all households have reported having the main source of drinking water within premises; whereas around 21 per cent of households have their main source of drinking water near premises, and approximately 8 per cent of households have it away from their premises (Table 6.14).

CTs have recorded that 61.88 per cent of households have their main source of drinking water within premises vis-à-vis 72.85 per cent ST households. While 19.92 per cent of households in STs have reported their main drinking water source as being near the premises, 25.43 per cent households in CTs have reported having their main source of drinking water near the premises as per Census 2011 figures. Moreover, 12.69 per cent

Table 6.14: Percentage Distribution of Households according to Distance of Main Source of Drinking Water: 2011

Size Class	Within Premises	Near Premises	Away
Statutory Towns total	72.85	19.92	7.24
Class I	77.58	16.44	5.99
Class II	66.47	23.96	9.57
Class III	62.92	26.91	10.17
Class IV	53.23	36.00	10.77
Class V	47.06	41.47	11.47
Class VI	61.62	30.29	8.09
Census Towns total	61.88	25.43	12.69
Class I	66.61	21.29	12.11
Class II	68.34	20.70	10.96
Class III	67.70	21.42	10.88
Class IV	61.54	26.43	12.03

Class VI	53.53	30.42	16.06

Source: Calculations based on Census of India data, 2011: Houses, Household Amenities and Assets

of households in CTs have had their main source of drinking water away from their premises as compared to 7.24 per cent of ST households.

Table 6.15 shows the percentage distribution of households by types of toilets across different size classes of STs, CTs and Urban India as per Census 2011 figures. Urban India has reported 18.6 per cent households with no latrine within premises. Almost one in five households in urban India have had no latrine within premises. The percentage is relatively higher in CTs where 20.57 per cent have no latrine within premises whereas STs have 18.57 per cent of such households.

Around 12.6 per cent households in urban India practise open defecation. 11.92 per cent households in STs and 17.66 per cent households in CTs have noted open defecation practices (Table 6.15). 41.05 per cent households go for open defecation in Class V STs. Class IV STs have also noted an alarmingly high per cent of households (34.04) reporting open defecation. Class VI CTs towns have recorded the highest percentage of households defecating in the open with 32.09 per cent. A higher percentage of public latrine usage in STs (6.65%) has been noted than that in CTs (2.91%).

**Table 6.15: Percentage distribution of Households by Types of Toilet:
STs, CTs and Urban India, 2011**

Size Class	Type of latrine facility within the premises						No latrine within premises	
	Flush/pour flush latrine connected to				Pit latrine	Service Latrine	Alternative source	
	Piped sewer system	Septic tank	Other system	Total			Public latrine	Open
STs total	36.41	37.29	1.59	75.29	5.63	0.50	6.65	11.92

Source: Calculations based on Census of India data, 2011: Houses, Household Amenities and Assets

Flush/pour flush latrines are the most popular type of latrine facility within premises amongst all other categories in CTs and STs. The presence of flush/pour flush latrines connected to either a piped sewer system or septic tank or any other system is much higher in STs (75.29%) than that in CTs (62.92%); though usage of septic tanks is relatively higher in CTs (46.13%) than that in STs (37.29%). While the use of a pit latrine in CTs (15.98%) is much higher than that in STs (5.63%), the percentage of households using service latrines is more or less the same in CTs and STs.

Again, among the connection options of flush/pour flush latrines, the septic tank is the most popular system in both CTs and STs. Among Class II towns, the septic tank has come out with the highest percentage of usage by households (Table 6.15).

Table 6.16 shows the percentage distribution of households with drainage facilities. While STs have reported 85.16 per cent of households having a connection to drainage facilities, CTs have noted 62.3 per cent of the same. Class I towns, on an average, have reported the maximum percentage of households connected to drainage facilities whereas Class V towns, be it ST or CT, have reported having the minimum percentage of households connected to drainage facilities. Instances of the percentage of HH with waste water outlet connected to closed drainage are much higher in STs (56.08%) than that in CTs (41.46%). Class I towns recorded the highest percentage of households connected to closed drainage facilities. Class IV STs (25.83%) and Class VI CTs (32.13%) noted the lowest percentage of households connected to a closed drainage facility.

Table 6.17 shows the percentage distribution of households by main sources of lighting as per Census 2011. Urban India has reported a 92.67 per cent of households being connected to electricity for main source of lighting. While usage of kerosene has been found as the second most popular source of lighting with 6.49 per cent of households dependent on that, other sources like solar energy, oil, etc. are negligible. It has been found that 0.34 per cent of households in Urban India, have recorded having no lighting facilities (Table 6.17).

Table 6.16: Percentage Distribution of Households with Drainage Facilities: 2011

Size Class	Percentage of Households			
	Drainage	No Drainage	Waste water outlet connected to	
			Closed drainage	Open drainage
STs total	85.16	14.84	56.08	43.92
Class I	90.10	9.90	64.55	35.45
Class II	78.50	21.50	36.82	63.18

Class VI	85.12	13.77	0.23	0.37	0.50

Source: Calculations based on Census of India data, 2011: Houses, Household Amenities and Assets

The percentage of households where electricity is the main source of lighting, is higher in STs (93.11%) than in CTs (90.14%). The percentage of kerosene using Households in CTs (8.98%) is a bit higher than that in STs (6.05%) as shown in Table 6.17. The maximum percentage of households connected to electricity for main source of lighting in STs has been found in Class I towns with 95.7 per cent, whereas amongst CTs, Class II towns top the list, with 94.74 per cent of households connected to electricity. Over 15 per cent households in Class IV and Class V STs have noted usage of kerosene. The same share is true for Class V and Class VI CTs. Class I STs make the maximum use of solar energy with 0.23 per cent of households using this source. Amongst CTs, Class V towns have recorded the highest usage of solar energy with 0.37 per cent of households using it. Class IV STs have the highest percentage of households with no lighting facilities (0.51%). Class VI CTs have the highest percentage (0.56%) of households having no lighting facilities.

Chapter 7

Conclusions and Policy Implications

Proper access to urban basic services is the key determinant of quality of life in urban areas. India has made investments in improving the infrastructure and basic amenities through various schemes and programmes. It is a fact that the Jawaharlal Nehru Urban Renewal Mission has provided for substantial central assistance to cities for infrastructure development, and has indeed been effective in renewing the country's focus on the urban sector. However, it has resulted in polarised development and an inbuilt big-city bias (Kundu, et al, 2011). The existing missions also focus on cities with populations above one lakh, thus excluding towns below 100,000 population. Also, many of the towns, especially the census towns are in a transition phase. These towns, although urban by Census definition, are essentially rural settlements under rural governance with income levels and level of services more akin to villages. The size of a city/town has a direct bearing on its level of basic services and socio-economic development. Thus big cities have a higher level of access to services and higher levels of socio-economic development as compared to small towns.

There is very poor data available on the status of housing, economy, land, finance, and governance of towns. This severely affects an analysis of these aspects of towns. Also, the towns suffer from lack of strong institutions of local governance. Administrative decentralisation in India has not been backed by financial decentralisation and devolution. Many local governments in towns are struggling to carry out their basic responsibilities; many are dysfunctional and spend most of their budget on general administration. The low property tax base, poor revenue collection and absence of user fees for services weakens their financial position. Private investment is also conspicuous by its absence in these towns. This has resulted in high dependence on grants from central and state governments.

Land and property are the only tangible assets many towns have as collateral that can create capital for investment and improvement in service delivery. However, the lack of proper inventories, registries and land records do not allow these ULBs to utilise these assets which results in asset rich and cash poor towns. Thus, despite government efforts in empowering local governments and investment in development projects, disparities between large and small cities/towns are widening. Correspondingly, polarity in investment and population is increasing.

In this chapter, following the introduction, the second section summarises the findings of the study. The third section groups all towns into five categories based on their level of infrastructure. The final section recommends the role of the government for each the five categories to improve the level of services in these towns.

Summary of Findings

Demography

The concentration of urban population in towns has been decreasing since 1961 while their numbers have been constantly increasing. In 1961, 48.1 per cent of the urban population resided in towns, whereas in 2011, the share came down to 29.8 per cent. On the contrary, there has been an increase in the number from 2,223 to 5,705 during the same period. Also, during the last decade (2001-2011), urban populations living in the metropolitan cities of India have increased from 37.8 to 42.3 per cent, with a corresponding decline in the non-metropolitan Class I cities from 30.8 per cent to 27.9 per cent. This is a pointer towards the top-heavy structure of the overall urban population in India.

Among towns, in 2011, the highest concentration of population is found in Class V towns followed by Class IV, Class III and Class II. In 2011, the proportion of population has decreased in the higher order of towns, that is, Class II, Class III and Class IV (though the numbers of towns have increased), and increased in the lower order towns, that is, Class V and VI reflecting a pyramidal urban structure.

The towns of India have registered a slow growth rate at 2.25 per cent as compared to average urban India, metropolitan cities and Class I cities. Metropolitan cities during the last decade registered a significant growth rate at 3.88 per cent. The growth rate of Class I cities and urban India during the same decade was 2.99 per cent and 2.76 per cent respectively. The growth rate among the various size classes of towns during the decade 2001-2011 systematically increases with the decreasing order of towns, reaching the highest in Class VI towns. The growth rate in Class II, III and IV towns is lower than the average urban India (2.76%) and towns as a whole (2.25%). Though the Class III category experienced a slow growth rate it added the highest number of people in absolute terms (6.7 million), whereas the Class VI category, which experienced the highest growth rate of 9.22 per cent added only 1.6 million people in absolute terms. As mentioned in the earlier chapter, Class VI towns show a different dynamics with higher demographic growth and level of services.

Out of 5,705 towns, 53 towns have a population above 90,000. These towns can be categorised as 'potential Class I cities'. The top three in this group of towns are Lakhisarai (Nagar Parishad) in the state of Bihar, with a population of 99,979, followed by Auraiya UA in Uttar Pradesh, with a population of 99,674, and Khambhat UA in Gujarat, with a population of 99,164.

Social Indicators

Among the various size class levels, there is not much difference in the average household size in 2011. The decade 2001-2011 witnessed a decline in the average size of households from 5.3 to 4.8 in towns. As per the Census of India 2011, the average household size is declining in all classes of cities and towns in India.

The towns of India have an overall sex ratio of 939, which is lower than the national average but higher than urban India. Among the Class II to Class VI size classes of towns, the highest sex ratio of 942 is observed in Class II and Class V categories. The child sex ratio of towns is 912, which is better than that of urban India. At the size class levels of towns, Classes II and III have the lowest sex ratio of 912. The ratio improves with the decreasing order of towns.

All the size classes of towns have shown improvement in literacy rates between 2001 and 2011. The female literacy rate has increased at a higher rate as compared to the male literacy rate in all the size classes of

towns. In 2011, towns reported a literacy rate of 80.2 per cent, which is lower than that of urban India. In 2011, the highest literacy rate was observed in Class VI towns (82.5%) followed by Class II towns (80.9%). An examination of gender-disaggregated data reveals a similar pattern.

There is not much variation in the work participation rate within the various size classes of towns. During 2001-2011, the WPR has seen an increasing trend in all the size classes of towns, as well as in the case of both male and female participation rates. The WPR in towns is 35.0 per cent, which is at par with urban India. At a gender disaggregated level, the female WPR in towns is only 16.2 per cent, whereas the male participation rate is 52.6 per cent in 2011. Three-fourths of the working population is engaged in the tertiary sector (74.9%). The share of cultivators declined marginally with a simultaneous increase of agricultural labourers in small towns during 2001-2011. It is important to note that at a gender disaggregated level, there is a higher share of male workers in other services as compared to their female counterparts, especially in small towns. Higher female participation is in the category of household workers. An in-depth analysis across the various size classes of towns reveals that the share of cultivators and agricultural workers is lowest in Class II towns as compared to other size classes of cities. The highest proportion of cultivators and agriculture labourers was observed in Class IV followed by Class V towns in 2011. The share of household workers increases with the increase in size class, except for Class VI which largely consists of industrial townships and cantonment boards as mentioned earlier.

The analysis of access to civic services brings out a strong relationship between the size of the city/town and availability of civic services. Access to tap water is higher in larger towns as compared to smaller ones. The dependence on ground water increases with the decreasing size class order of towns. The highest proportion of households having access to safe drinking water is in Class II towns (82.0%) and the lowest is in Class VI towns (74.5%).

Basic Infrastructure

There is a variation in terms of access to toilet facilities at the size class levels. In Class II towns, 82.1 per cent of the households have access to toilets. This proportion of households decreases further with only 65.7 per cent having access to toilets in Class V. In terms of the access to flush/pour flush latrine facility, only 66.8 per cent of the households in Class II towns, 58.4 in Class III, 50.8 in Class IV and 45.3 per cent in Class V towns are connected. Overall, the towns are largely dependent on septic tanks (43.91%) and the proportion of households connected with a piped sewer is only 11.17 per cent.

This section tries to categorise towns according to their status of basic infrastructure. For carrying out such an analysis, basic infrastructure index values were calculated based on the following parameters: the percentage of households with (i) access to tap water from treated source within premises; (ii) flush latrine facility with piped sewer within the premises; (iii) bathroom within the premises; and (iv) waste water outlet connected to closed drainage. The towns were grouped into the categories of achievers, aspirers, average, laggards and deprived based on the index values. The range of index was taken to categorise towns into five groups:

Achievers = Towns which have index value of 3.3872 and above

Aspirers = Towns which have index value between 2.0300 to 3.3871

Average = Towns which have index value between 0.6727 to 2.0299

Laggards = Towns which have index value between -0.6845 to 0.6726

Deprived = Towns which have index value between -2.0418 to -0.6844

There are 65 towns that are best in all the indicators of infrastructure performance. This group could be termed 'achievers', and has huge potential for further development.

A group of 184 towns could be termed 'aspirers' as they have not performed well on any one of the four indicators of infrastructure performance.

A group of 784 towns have performed well on two indicators of infrastructure and could be termed as 'average'.

A group of 1,312 towns is found to be deficit in three indicators of infrastructure performance. This group of towns could be called "laggard".

A group of 3,354 towns is found to be in severe crisis with respect to all the four infrastructure indicators. This group of towns could be called 'deprived'.

The above classification would help to prioritise the towns for improvement of infrastructure.

Recommendations

The studies on economic growth, structural transformation, employment, poverty, basic infrastructure, housing, and social sector attainment levels have inevitably looked at 'urban' as a single entity, thus overlooking the huge differences that exist between small towns, medium towns and large metropolises. Urban India, includes 7,933 settlements with populations ranging from just 5 to as large as 18 million. Non-recognition of this heterogeneity and considering urban sector as a monolith sector has led to unplanned urban growth. The policies and programmes need to take into consideration the size of a city/town which in a way affects its economic performance. Metropolitan cities in India are better off than their non-metro counterparts. Also, it would be erroneous to treat all towns as a homogeneous group as wide disparities exist even in this group with regard to their levels of social development and access to basic amenities. The following section details out the recommendations for the five sub-categories of the cities.

Achievers

This group termed as 'Achievers' can be considered as a "good practice group" which can be replicated by the other towns. This group has towns from all size classes of towns (II to VI). All these towns have a governance structure and infrastructure service delivery mechanism in place. These Achievers towns have the potential to develop through better policies, planning, financing and incentive structures.

Aspirers

These towns are deficit in any one of the basic services but show good overall infrastructure performance. Government/HUDCO may fund in these towns. Financial support to this group of towns will act as a catalyst in unlocking the development potential. The focus of such an initiative must be on improving linkages, connectivity and key infrastructure that will result in building economy and induce investment for local economic development.

Average

This set, 'Average' towns, has the potential to finance infrastructure provision by improving the tax base and

user charges. Also, financing could be possible through institutional funding. Strengthening of the local tax base of the ULBs in these towns by improving the property tax base and user charges as attempted under JNNURM may help in improving the overall scenario. Also, centrally sponsored schemes could improve the level of infrastructure in these towns.

Laggards

A large number of towns fall in this category. 'Laggard' towns, have low levels of infrastructure. They are in the vicious circle of development. The cumulative gap of urban service delivery over the past has to be compensated by larger investments in the coming years. Centrally sponsored schemes and state schemes could improve the level of infrastructure in these towns.

Deprived

The 'Deprived' towns are visibly deficient in basic infrastructure, which also affects their economic performance. The current service levels are extremely low relative to the required amount to sustain the quality of life in these towns in the coming years. The cumulative gap of urban service delivery over the past has to be compensated by larger investments in future years. Urban local bodies in such cities do not have the capacity to invest in augmenting the level of services. Therefore, additional central and state assistance is required to address these deficiencies. Also, institutional funds need to be channellised to these towns at low rates of interest.

Summing Up

This report has brought out clearly that towns grouped under one class based on population size exhibit differential levels of performance on socio-economic and infrastructure indicators. It is important to take cognisance of this factor by government/HUDCO while framing policies and programmes for these towns. Many of the towns are transition points between the urban and the rural. The process of moving from rural to urban throws up some unique challenges that require more than standard solutions.
